Spend less. Test more.

Faster, easier and more economical digital testing. That's what CSC's Logic Probes are all about. And that's what engineers, technicians and hobbyists need, to deal with the increased use and complexity of digital circuits.

Unlike oscilloscopes, meters and other conventional test equipment, CSC probes are *logic-state oriented:* Just touch the probe to a circuit node and *instantly* read logic state, detect level transitions, check duty cycles. And store high-speed, low-rep-rate events that even fast scopes miss.

By accurately detecting the state of individual logic elements without removing ICs or cutting copper paths, CSC's circuit-powered,

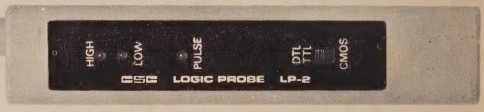

multi-family Logic Probes locate over 95% of circuit problems in minutes instead of hours. And they're easy to use. Simply connect two clip leads across the power supply, touch the probe tip to a node and watch the LEDs.

LP-1 LOGIC PROBE. $44.95*

LP-1 has a minimum detectable pulse width of 50 nanoseconds and maximum input frequency of 10 MHz. This 100 K ohm probe is an inexpensive workhorse for any shop, lab or field service tool kit. It detects high-speed pulse trains or one-shot events and stores pulse or level transitions, replacing separate level detectors, pulse detectors, pulse stretchers and pulse memory devices. All, for less than the price of a DVM.

LP-2 LOGIC PROBE. $24.95*

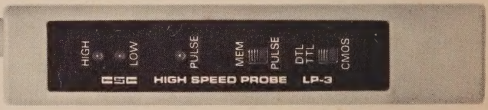

LP-2 performs the same basic functions as the LP-1, but for slower-speed circuits and without pulse memory capability. Handling a minimum pulse width of 300 nanoseconds, this 300 K ohm probe is the economical way to test

circuits up to 1.5 MHz. It detects pulse trains or single-shot events in TTL, DTL, HTL and CMOS circuits, replacing separate pulse detectors, pulse stretchers and node state analyzers.

LP-3 LOGIC PROBE. $69.95*

Our LP-3 has all the features of the LP-1 plus extra high speed. It captures pulses as narrow as 10 nanoseconds, and monitors pulse trains to over 50 MHz. Giving you the essential capabilities of a high-quality memory scope at *about 1/100th the cost.* LP-3 captures one-shot or low-rep-rate-events all-but-impossible to detect any other way. All without the weight, bulk, inconvenience and power consumption of conventional methods.

Use CSC's highly versatile logic probes for testing, debugging or servicing any type of digital circuit. They give you a lot of information about IC circuit conditions . . . and help you do more in less time. For less money.

NEED MORE INFORMATION? CALL 203-624-3103 to order, or for the name of your local distributor. Prices slightly higher outside U.S.A.

CIRCLE 11 ON READER SERVICE CARD

This NEW MFJ Versa Tuner II . . .

has SWR and dual range wattmeter, antenna switch, efficient airwound inductor, built in balun. Up to 300 watts RF output. Matches everything from 1.8 thru 30 MHz: dipoles, inverted vees, random wires, verticals, mobile whips, beams, balanced lines, coax lines.

NEW, IMPROVED MFJ-941B HAS . . .
- More inductance for wider matching range
- More flexible antenna switch
- More sensitive meter for SWR measurements down to 5 watts output

$89.95

Transmitter matching capacitor. 208 pf. 1000 volt spacing.

Sets power range, 300 and 30 watts. Pull for SWR.

Meter reads SWR and RF watts in 2 ranges.

Efficient airwound inductor gives more watts out and less losses.

Antenna matching capacitor. 208 pf. 1000 volt spacing.

Only MFJ gives you this MFJ-941B Versa Tuner II with all these features at this price:

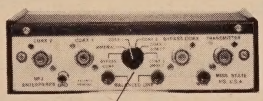

A SWR and dual range wattmeter (300 and 30 watts full scale) lets you measure RF power output for simplified tuning.

An antenna switch lets you select 2 coax lines direct or thru tuner, random wire/balanced line, and tuner bypass for dummy load.

A new efficient airwound inductor (12 positions) gives you less losses than a tapped toroid for more watts out.

A 1:4 balun for balanced lines. 1000 volt capacitor spacing. Mounting brackets for mobile installations (not shown).

With the NEW MFJ Versa Tuner II you can run your full transceiver power output — up to 300 watts RF power output — and match your transmitter to **any** feedline from 160 thru 10 Meters whether you have coax cable, balanced line, or random wire.

ANTENNA SWITCH lets you select 2 coax lines direct or thru tuner, wire/balanced line, dummy load.

You can tune out the SWR on your dipole, inverted vee, random wire, vertical, mobile whip, beam, quad, or whatever you have.

You can even operate all bands with just one existing antenna. No need to put up separate antennas for each band.

Increase the usable bandwidth of your mobile whip by tuning out the SWR **from inside your car.** Works great with all solid state rigs (like the Atlas) and with all tube type rigs.

It travels well, too. Its ultra compact size 8x2x6 inches fits easily in a small corner of your suitcase.

This beautiful little tuner is housed in a deluxe eggshell white Ten-Tec enclosure with walnut grain sides.

SO-239 coax connectors are provided for transmitter input and coax fed antennas. Quality five way binding posts are used for the balanced line inputs (2), random wire input (1), and ground (1).

NEW 300 WATT MFJ VERSA TUNER II'S: SELECT FEATURES YOU NEED.

NEW MFJ-945 HAS SWR AND DUAL RANGE WATTMETER.

$79.95 BRAND NEW

Same as MFJ-941B but less 6 position antenna switch.

NEW MFJ-944 HAS 6 POSITION ANTENNA SWITCH ON FRONT PANEL.

$79.95 BRAND NEW

Same as MFJ-941B but less SWR/Wattmeter.

NEW MFJ-943 MATCHES ALMOST ANYTHING FROM 1.8 THRU 30 MHz.

$69.95 BRAND NEW

Same as MFJ-941B, less SWR/Wattmeter, antenna switch, mounting bracket. 7x2x6 in.

ULTRA COMPACT 200 WATT VERSA TUNERS FOR ALL YOUR NEEDS.

MFJ-901 VERSA TUNER MATCHES ANYTHING, 1.8 THRU 30 MHz.

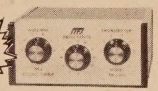

$59.95 BRAND NEW

Efficient 12 position air inductor for more watts out. Matches dipoles, vees, random wires, verticals, mobile whips, beams, balanced lines, coax. 200 watts RF, 1:4 balun, 5x2x6 in.

MFJ-900 ECONO TUNER MATCHES COAX LINES/RANDOM WIRES.

$49.95 BRAND NEW

Same as MFJ-901 but less balun for balanced lines. Tunes coax lines and random lines.

MFJ-16010 RANDOM WIRE TUNER FOR LONG WIRES.

$39.95

1.8 thru 30 MHz. Up to 200 watts RF output. Matches high and low impedances. 12 position inductor. SO-239 connectors. 2x3x4 inches. Matches 25 to 200 ohms at 1.8 MHz. Does not tune coax lines.

IC-701, the HF (160–10M) Maximizer

THE ULTIMATE SYNTHESIZED HF TRANSCEIVER

ICOM's superior LSI technology introduces the most advanced transceiver in the HF world, the **IC-701!** Now ICOM's famous One/Two Team of **single knob** frequency selection and **dual VFO's** leaps to the forefront of HF with an extremely compact, all solid state, fully synthesized, 100 W CONTINUOUS OUTPUT Maximizer of all modes and all bands, from **160-10M.** The **IC-701** is the ICOM breakthrough you've been waiting for: the future in HF.

- **Dual Independent VFO's Built-in:** At no extra cost, **two** digitally synthesized, independently selectable VFO's are standard with every **IC-701.**
- **100 WATTS OUTPUT:** The compact **IC-701** delivers an amazing 100 WATTS OUTPUT, from a completely solid state, no tune final, on all modes and all bands!
- **All HF Bands, 160-10M:** Fullband coverage of each of the six bands, plus some extra coverage for MARS.
- **Fully Synthesized Tuning:** No time-lag: no backlash: unbelievable bandspread, with 100 Hz per division and 5 KHz per turn.
- **Continuously Variable Bandwidth:** The **IC-701** provides all filter widths for SSB, CW, RTTY, and even SSTV.
- **Double Balanced Schottky Diode 1st Mixer** is standard to provide the finest receiver IMD possible in a Hamband transceiver.
- **RF Speech Processor:** This is an **IC-701** standard feature at no extra cost.
- **VOX; Fastbreak in CW; RIT; AGC; Noise Blanker; Full Metering;** and many more ICOM quality standard features come with your **IC-701** HF Maximizer.

The new **IC-701** is simply the best HF transceiver ever made: that's all. For more information and your own demonstrations, see your ICOM dealer. The ultimate HF Maximizer is yours in your ICOM **IC-701.**

Sold complete, with base mic and AC power/speaker, as shown.

IC-701 meets FCC Part 97.73.

All ICOM radios significantly exceed FCC specifications limiting spurious emissons.

Specifications: ☐ Frequency Coverage: 1.8 MHz — 2.0 MHz; 3.5 MHz — 4.0 MHz; 7.0 MHz — 7.5 MHz; 14.0 MHz — 15.2 MHz; 21.0 MHz — 21.5 MHz; 28.0 MHz — 30.0 MHz ☐ Frequency Control: LSI based 100 Hz step Digital PLL synthesizer. Independent Transmit-Receive duplex on same band, standard with every radio. ☐ Frequency Readout: 6 digit LED 100 Hz readout ☐ Power Supply Requirements: DC 13.6 V ± 15% Negative ground current drain, 18 A max at 100 W output; AC power supply, speaker console for AC operation ☐ Antenna Impedance: 50 ohms unbalanced, VSWR 2.0:1 ☐ Weight: 7.3 Kg ☐ Size: (transceiver unit only) 111mm (h) × 241mm (w) × 311mm (d) ☐ RF Power Output: CW (A1), RTTY (F1), 100 W; SSB (A3J), 100 W PEP; Continuously adjustable 0-100W ☐ Emission Modes: A1, CW; A3J, SSB; F1, RTTY ☐ Harmonic and Spurious Output: more than 60 dB below peak power (meets FCC 97.73) ☐ Carrier Suppression: more than 40 dB down ☐ Unwanted Sideband: more than 40 dB down at 1000 Hz AF input ☐ Microphone Impedance: 600 ohms ☐ Receiving System: triple conversion, super heterdyne, with continuous bandwidth control (100 Hz — 2.4 KHz) ☐ Receiving Modes: A1, A3J (USB/LSB), F1 ☐ IF Frequencies: 1st & 3rd, 9.0115 MHz; 2nd, 10.7015 MHz; with continuous bandwidth control ☐ Sensitivity: better than 0.25 microvolts for 10 dB S+N/N ☐ Selectivity: SSB, RTTY, ± 1.1 KHz at −6 dB (adjustable to ± 0.5 KHz min), ± 2.0 KHz at −60 dB; CW, ± 250 Hz at −6 dB ± 700 Hz at −60 dB; CN-N, ± 100 Hz at −6 dB, ± 500 Hz at −60 dB (with Audio Filter) ☐ Spurious Response Rejection Ratio: better than 60 dB

Zero Bias

an editorial

These are far from the Halcyon Days of amateur radio. Rather than a calming effect we are facing a change from what we have previously experienced. Rather than the slow gradual growth that amateur radio has traditionally seen, we now see more and more amateurs joining our ranks. We see technology change practically before our eyes and speak in terms and expressions that didn't exist a short while ago. Equipment today can truly be said to be over-engineered, going far beyond functional necessity in amateur radio terms and delving into the beauty of what can be done as a practical exercise in imagination. "Wouldn't it be nice to have" translates rather rapidly into an add-on feature in the next production run.

We as amateurs take a lot of this change as a matter of course. The whole concept of microprocessors, computers, digital displays and all sorts of very sophisticated hardware are almost taken for granted. The newcomer to amateur radio is almost forced to bypass the hard-wire stage, gaze quizzically at vacuum tubes and wouldn't even conceive of stripping down an old TV chassis for parts. Gone for the most part are the stores with row upon row of metal drawed cabinets housing "parts" each with its characteristic smell and feel. They have been replaced by blister-packed merchandise and row upon row of clear plastic drawers with miniature multi-colored "parts" sort of like a modern penny candy store. With the advent of "plastic money", equipment that could only have been dreamed about can be had now with plenty of time to pay for it.

By and large, the newcomer to amateur radio is coming to us via the ranks of CB. The fledgling Novice or Technician is accustomed to "talking" and is drawn to two meter f.m. There he/she can not only talk but also get to use some pretty sophisticated equipment, far more intricate than standard CB fare. The challenge comes a little later when the lure of talking at even greater distances surfaces and our amateur friend starts to think of the h.f. bands.

It is generally at this point that one starts to consider whether or not it is easier and more fun to build or to buy equipment. The old saw about amateurs not building anymore has some truth to it only with respect to the complexity of available gear. Granted that the first time builder is not about to tackle a complex transceiver from scratch, as a rule, he will probably start with station accessories or a kit. If he can get over the hurdle of digging into whatever equipment he already has, he might look to modifying and hopefully improving his existing station. Specific tools and test equipment generally come along little by little as needs arise. Some of our most popular articles in *CQ* were on the use of tools and test equipment.

This month our lead article features a transmitter that can be built by practically anybody. It's not super elaborate nor is it within the realm of state-of-the-art. It is designed to be simple and functional . . . to give you the experience and joy of building a rig and getting it on the air. I'd like to see more straightforward construction from all you builders out there. Let's give the newcomer something to cut his teeth on and give a few of us an excuse to dig out those old tools.

Ade Weiss rejoins us next month fully refreshed after a six month sabatical in England. I received his January column this week along with a list of what he accomplished while in England and I must say I am envious. It's a wonder he had any time left at all for amateur radio.

This note is a little late, but better late than never. Our own Frank Anzalone, W1WY, underwent surgery this September. At this time he should be in much better shape and feeling a lot better. You might take some time during this holiday season to send an additional card to Frank wishing him a speedy recovery.

I'd like to close by wishing you the happiest of holidays and the best of new years to come from all of us here at *CQ*.

73, Alan, K2EEK

KENWOOD

. . . pacesetter in amateur radio

The TS-520S, the most popular Amateur Radio transceiver in the world

. . . provides a foundation for an expanding series of accessories designed to please any ham . . . from Novice to Amateur Extra.

TS-520S

The TS-520S transceiver provides full transmit and receive coverage of all Amateur bands from 160 through 10 meters. It also receives 15.0 (WWV) to 15.5 MHz and another 500-kHz range of your choice in the auxiliary band position. With the optional DG-5, you have a large digital frequency readout when transmitting and receiving, and the DG-5 also doubles as a 40-MHz frequency counter. The TS-520S includes a built-in AC power supply, and, with the addition of the optional DS-1A DC-DC converter, it can function as a mobile rig. It features a very effective noise blanker, RIT, eight-pole crystal filter, 25-kHz calibrator, front-panel carrier level control, semi-break-in CW with side-tone, built-in speaker, heater switch, 20-dB RF attenuator and easy phone-patch connection. RF input power is 200 W PEP on SSB and 160 W DC on CW. Carrier suppression is better than —40 dB and sideband suppression is better than —50 dB. Spurious radiation is less than —40 dB. Receiver sensitivity is 0.25 μV for 10 dB (S+N)/N. Selectivity is 2.4 kHz at —6 dB/4.4 kHz at —60 dB and, with the optional CW-520 CW filter, is 0.5 kHz at —6dB/1.5 kHz at —60 dB.

See your local Authorized Kenwood Dealer for more information, and a super deal!

A great station . . . at an affordable price! The TS-520S with its companion accessories . . . including two new units. The AT-200 antenna tuner provides a versatile tool in any station. The other is the TV-502S, Kenwood's 2 meter transverter for SSB and CW operation from 144 to 146 MHz.

TRIO-KENWOOD COMMUNICATIONS INC.
1111 WEST WALNUT/COMPTON, CA 90220

KENWOOD

...pacesetter in amateur radio

EVERY FEATURE YOU COULD POSSIBLY WANT IN A 2-METER FM RIG IS AVAILABLE NOW IN THE KENWOOD TR-7600

Even without its optional "Remote Controller", the TR-7600 gives you . . .

- Full 4-MHz coverage (144.000-147.995 MHz) on 2 meters
- 800 channels
- Dual concentric knobs for fast frequency change (100-kHz and 10-kHz steps)
- 5-kHz offset switch
- MHz selector switch . . . for desired band (144, 145, 146, or 147 MHz)
- Mode switch for operating simplex or for switching the transmit frequency up or down 600 kHz for repeater operation . . . or for switching the transmitter to the frequency you have have stored in the TR-7600's memory (while the receiver remains on the frequency you have selected with the dual knobs)

TR-7600

...the radio that remembers

Actual size

- Memory channel . . . with simplex or repeater (plus or minus 600 kHz transmitter offset) operation
- Digital frequency display (large, bright, orange LEDs)
- UNLOCK indicator . . . an LED that indicates transceiver protection when the frequency selector switches are improperly positioned or the PLL has malfunctioned
- 10 watts RF output (switchable to 5 watts low power)
- Noise-cancelling microphone
- Compact size (only 6-7/16 inches wide, 2-7/16 inches high and 9-3/16 inches deep)

The optional Remote Controller, with a built-in microprocessor, provides more operating features to the TR-7600 2-meter FM transceiver than found in any other rig! With the Remote Controller attached to your TR-7600, you can . . .

- Select any 2-meter frequency
- Store frequencies in six memories
- Scan all memory channels
- Automatically scan up all frequencies in 5-kHz steps
- Manually scan up or down in 5-kHz steps
- Set lower and upper scan frequency limits
- Reset scan to 144 MHz
- Stop scan (with HOLD button)
- Cancel scan (for transmitting)
- Automatically stop scan on first busy or open channel
- Operate on MARS (143.95 MHz)
- Select repeater mode (simplex, plus transmit frequency offset, minus offset, or any of six memory transmit offsets)
- Select transmit offset (1 MHz/600 kHz)

The Remote Controller's display indicates frequency (even while scanning) and functions (such as autoscan, lower scan frequency limit, upper scan limit, error, and call channel).

Subject to FCC approval.

TRIO-KENWOOD COMMUNICATIONS INC.
1111 WEST WALNUT/COMPTON, CA 90220

there's a world of difference in TEN-TEC's *all-new* hf transceiver—

OMNI

Please send all reader inquiries directly

OMNI—THE *ALL-INCLUSIVE*. Because OMNI has it *all*. Designed to give you every advantage, every capability, whatever your operating specialty. Designed to give you new conveniences and new levels of performance. Designed to give you the world of Amateur Radio with a world of difference—the OMNI world of unique features. An unusual combination not found in any other.

FUNCTIONAL STYLING. The "look" you requested. "Clamshell" aluminum case clad in textured black vinyl. Complementary nonreflective warm dark metal front panel. Extruded satin aluminum trim bezel and tilt bail. Convenient controls. Fully shielded. And everything in a larger, easier-to-use size: 5¾"h × 14¼"w ×14"d.

TOTALLY SOLID-STATE. Sharing the TEN-TEC heritage of solid-state design leadership with its companion transceivers, the highly successful 540/544, OMNI has all the advantages of proven solid-state technology—reliability, long life, cool performance, better stability.

8-BANDS. The world now and in the future. OMNI covers 160, 80, 40, 20, 15, and 10 meters now (crystals included for all present Amateur bands, 1.8-30 MHz). And it has convertible 10 MHz and "AUX" band positions for the future.

BROADBAND DESIGN. Permits changing bands without tune-up, without danger of out-of-resonance damage to the final stage.

ANALOG OR DIGITAL READOUTS. OMNI-A features an analog dial with 1 kHz dial markings. OMNI-D has 0.43" LED readouts with the 5 most significant in red and the 6th in green to show 100 Hz increments.

BUILT-IN VOX AND PTT. Smooth VOX action with 3 easy-to-adjust front panel controls. PTT control is available at both front and rear panel jacks; an external microphone switch may be used.

BUILT-IN SQUELCH. Unusual in an hf rig, but handy for tuning or monitoring for a net or sked.

BUILT-IN 4-POSITION CW/SSB FILTER. 150 Hz bandwidth with 3 selectable skirt contours for optimum CW reception.

8-POLE CRYSTAL FILTER. 2.4 kHz bandwidth, 1.8 shape factor.

SEPARATE MODE SWITCH. Permits using *all* filters in *any* mode.

2-SPEED BREAK-IN. Switch to "fast" or "slow" receiver muting to accomodate any band condition or mobile operating.

2-RANGE OFFSET TUNING. Switch-select the ±5 kHz range for off-frequency DX work or the ±0.5 kHz range for fine tuning.

OPTIMIZED RECEIVER SENSITIVITY. Ranges from 2 uV on 160 m to 0.3 uV on 10 m (10 dB S+N/N) to achieve ideal balance between dynamic range and sensitivity.

GREATER DYNAMIC RANGE. Typically exceeds 90 dB to reduce possible overload from nearby stations. Also includes switchable 18 dB PIN diode attenuator for additional overload prevention.

WWV RECEPTION. On the 10 MHz band switch position.

FRONT PANEL CONTROL OF LINEAR/ANTENNA BAND-SWITCHING. Auxiliary bandswitch terminals on back panel for simultaneous control of external relays or circuits with the OMNI bandswitch.

BUILT-IN PHONE PATCH JACKS. Provide interface to speaker and microphone audio signals for phone patch connection.

BUILT-IN "TIMED" CRYSTAL CALIBRATOR. In the OMNI-A a pulsed 25 kHz calibrator desensitizes the receiver and provides an automatic 5 to 10 second "on" time for easy two-hand dial skirt adjustment.

BUILT-IN ZERO BEAT SWITCH. Permits placing your transmitted signal exactly on the listening frequencies of CW stations.

BUILT-IN SWR BRIDGE. The "S" meter electronically switches to read SWR every time you transmit to provide a continuous antenna check.

FRONT PANEL MICROPHONE AND PHONE JACKS.

ADJUSTABLE AUTOMATIC LEVEL CONTROL. For setting output power level from low power to full output, for retaining low distortion at desired drive power to linear amplifier.

SEPARATE RECEIVING ANTENNA CAPABILITY. Rear panel switch and jack connect receiving section to common antenna or separate receiving antenna. Also acts as receiving antenna by-pass when used with instant break-in linear amplifiers.

BUILT-IN ADJUSTABLE SIDETONE. Variable pitch and volume.

DUAL COMPRESSION-LOADED SPEAKERS. Larger sound output, lower distortion, no external speaker needed.

POWER INPUT. 200 watts when used with 50 ohm load. Proven, conservatively-rated, solid-state final amplifier design with full warranty for first year and pro-rata warranty for 5 additional years.

100% DUTY CYCLE. Ideal for RTTY, SSTV, or sustained hard usage.

PLUG-IN CIRCUIT BOARDS. For fast, easy field service.

POWER. Basic 12 VDC operation for convenient mobile use; external supply required for 117 VAC operation.

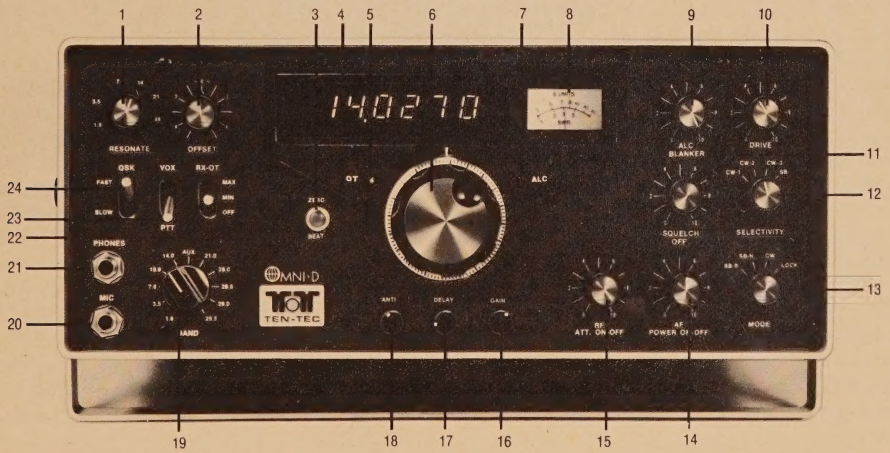

OPTIONAL ACCESSORIES. As all-inclusive as OMNI is, there are a few options: Model 645 Keyer, 243 Remote VFO, 248 Noise Blanker, 252M Power Supply.

Model 545 OMNI-A $899 Model 546 OMNI-D $1069

Experience the world of difference of OMNI, see your TEN-TEC dealer or write for details.

24 QSK (full break-in) SWITCH; 2-position: Fast-Slow.

Amateur Radio has lost a good friend

On Sunday, September 24, 1978 Lawrence W. LeKashman, W2AB passed away. He would have turned 58 in just another week. Larry was one of those dynamic people who leave an impact wherever they've been. His impacts on Amateur Radio have been many.

Larry was first licensed as an amateur at the age of twelve. Within just a few short years he became recognized throughout the world of ham radio as an outstanding contest operator and DX'er. His first call, W2IOP became synonomous with top operational performance. Over the years the call changed to W8IOP, W9IOP and back again as Larry's career moved him across the country. More recently W8AB, and finally W2AB were the calls Larry chose to use.

Back in 1944, while still a navigator in the Army Air Force, Larry approached my dad with the idea for a new ham magazine. CQ was that magazine. Although he couldn't officially accept a job on the magazine until his military discharge became final, Larry was, in effect, the first editor of CQ. When the first issue appeared in January of '45 his name didn't even appear on the masthead. The second issue carried a feature article by him, as did the third. By the time the April issue went to press Larry was officially CQ's Assistant Editor; a few months later and the title became Managing Editor. But it wasn't until the February, 1949 issue that Larry finally received recognition as CQ's actual editor. He remained with the magazine for about another six months, moving on the RCA as Sales Manager for the distributor products division.

After a short stint at RCA Larry moved on to bigger and better positions throughout the electronic industry. After many productive years as Vice President of Electro-Voice, he joined Bogen-Presto as Chief Executive Officer. Then back to E-V as President after Al Kahn's retirement. Next a move to Olson Electronics as President, then to Lafayette as Executive Vice President. And finally, back to Electro-Voice where he served as Vice President until his demise.

To know Larry was to like him. There was no way not to like this hardworking, energetic dynamo. If Larry had any fault it was that he worked too hard, putting in 16 to 18 hours a day right through the year. He commented to me once that his wife had begun to refer to him as a work-a-holic, and that he was considering slowing down to a normal ten or twelve hour work day. That was Larry. A fine executive, a superb salesman, but more important, a good friend to those of us in the industry who were fortunate enough to work with him.

Amateur Radio has lost one of its strongest supporters. Many of us within the hobby have lost a good friend. We'll miss you, Larry.

Richard A. Cowan, WA2LRO
Publisher, CQ

DSI
QUIK-KIT®

550 MHZ COUNTER KIT

Performance You Can Count On

OPERATES ON

- •Batt 6-C Size
- •DC 8.2 To 14.5 VDC
- •AC Batt. Eliminator

$99.95

MODEL 3550 KIT

DSI OFFERS THE BEST OF TWO WORLDS . . . An unprecendented DSI VALUE . . . in a high quality, LSI Design, 550 MHZ frequency counter kit. And, because it's a DSI innovation, you know it obsoletes any competitive makes, both in price & performance. The basic 550 MHZ counter & time base are factory assembled, tested and burned-in. The problems of bad LEDS, IC's, capacitors, are a thing of the past with DSI QUIK-KIT®. But you can take pride in assembling the power supply, PC mounted selector switch, input connectors, and the final mechanical assembly of your 550 MHZ counter, into its' handsome cabinet. **GO WITH THE LEADER . . . BUY A DSI FREQUENCY COUNTER KIT. SAVE TIME & MONEY AND BE ASSURED IT WILL WORK THE FIRST TIME.**

SPECIFICATIONS

Time Base TCXO 1PPM 65° to 85°F
Frequency Range 50HZ to 550MHZ
Resolution 1HZ to 55MHZ, 10HZ to 550MHZ
Gate Time 1 second - 1/10 second
Sensitivity 25MV 150 & 250MHZ 75MV 550MHZ
Display Eight 1/2-inch LEDS
Input Two SO239 Connectors
Power 6C-Size Batt., 15HR, or 8.2VDC to 14.5VDC
Current 150 Ma standby 300 Ma operational

3550 KIT INCLUDES

- •Pre-assembled, tested counter board
- •Case, power supply, connectors, hardware
- •Built-in prescaler & preamp
- •Gate Light - Automatic Zero Blanking
- •Automatic Decimal Point
- •One to two hours assembly time
- •One Year Warranty on all parts
- •All new parts - not factory seconds or surplus

3550 Kit	$99.95
T-101 Telescopic Antenna	3.95
AC-9 Battery Eliminator	7.95
Cigarette Lighter DC Adapter	2.95

CIRCLE 13 ON READER SERVICE CARD

ATLAS RX-110...A high performance amateur band receiver at a fantastic low price!

THIS IS THE AMATEUR BAND RECEIVER YOU'VE BEEN WAITING FOR!

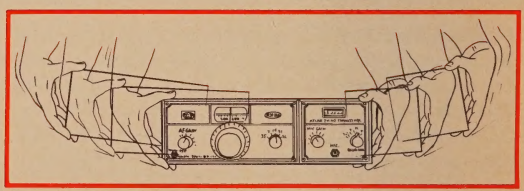

It's perfect for the newcomer to amateur radio who wants a low cost receiver to monitor all the action on the ham bands, or for the old timer who wants an extra receiver without having to spend a fortune.

The Atlas RX-110 is all solid state and provides full coverage of 15, 20, 40 and 80 meters, and 28 to 29 MHz on the 10 meter band, with reception of CW Single Side Band. It is self-contained with its own AC supply and speaker and can also operate on 12 to 14 VDC.

The RX-110 offers well illuminated, easy to read tuning dial, velvet smooth tuning, and its handsome cabinet with attractive panel design is compact in size, and lightweight. Solid state design, with high sensitivity, selectivity, and dynamic range...make it comparable to receivers costing several times more. Yet because of its simplicity of design, and our well known value engineering, the cost is remarkably low.

AND HERE'S THE REAL CLINCHER!

We've made a matching solid state TX-110 transmitter module that plugs into the RX-110 and PRESTO! You have a 5 band transceiver at an unbelievable low cost!

With this completely new concept in receiver/transceiver design, we've produced a real breakthrough in low cost amateur equipment: A superb, low cost receiver to start with, and for the small extra cost of the TX-110 module, a complete 5 band CW-SSB transceiver!

SUGGESTED RESALE PRICE ..... $229.

CIRCLE 3 ON READER SERVICE CARD

THE EXCITING 110 LINE

A completely new concept in receiver/transceiver design!

RX-110 Receiver + TX-110 Transmitter Module: PRESTO! You have a complete 5 band transceiver!

WE'VE PRODUCED A REAL BREAKTHROUGH IN VERSATILE LOW COST AMATEUR EQUIPMENT!

- The Atlas 110 all solid state transceiver provides CW and SSB communications on 10, 15, 20, 40, and 80 meters with a choice of two power levels.
- The TX-110-L runs 15 watts input on 20, 40, and 80 meters; 10 watts input on 10 and 15 meters.
- The TX-110-H runs 200 watts input on 20, 40, and 80 meters; 150 watts on 15 and 100 watts on 10 meters.
- Full band coverage on 15 through 80 meters; 28 to 29 MHz on 10 meters.
- Semi-break-in CW with sidetone monitoring is a standard feature.
- PTT (Press-to-Talk) operation on SSB. Lower sideband on 40 and 80 meters. Upper sideband on 10, 15, and 20 meters.
- TX-110-L 15 watt module runs on AC supply in RX-110, so it is completely self contained, including speaker. Simply connect antenna, and key or mike.
- TX-110-H requires additional AC supply to supply high current for 200 watt amplifier (Model PS-110).
- 200 watt amplifier may be added to TX-110-L at a later date, thus converting it to a TX-110-H.
- Modular design provides much easier service and maintenance. With cabinets removed everything is wide open and fully accessible. This is a piece of solid state equipment you can work on yourself, if you wish, because you can get at everything with ease.
- The RX-110, TX-110-L, and TX-110-H will all run directly from a 12 to 14 volt DC battery supply for mobile or portable operation. When the two units are mechanically joined (brackets supplied with TX-110), the transceiver slides into a plug-in mobile mount, model MM-110.

SUGGESTED RESALE PRICES:

RX-110	**$229.**
TX-110-L	**$159.**
TX-110-H	**$249.**
PS-110	**$ 89.**

Announcing

• The W2ONV "Delta/Slope" antenna article, which appeared in the August 1978 issue, has been a very large success. Author Bill Salerno wrote the CQ editorial staff recently that he has been buried with inquiries about this popular antenna. However, there seems to be some confusion with regard to the diagram published in Bill's article.

Because the antenna was so well received, we are publishing a more detailed diagram for those who feel the original illustration was no explicit enough.

• Blind amateurs who own (or who are interested in) Yaesu equipment can obtain free recordings of the Annual Sets of the International Fox-Tango Club's newsletters for the years of 1976, 1977, and 1978 by sending blank 90-minute casettes to Tom Warrenburg, Route 3, Box 625, Delavan, WI 53115. Tom, himself handicapped and struggling to pass the Novice examination, will transcribe the Newsletter from Master Tapes he has prepared and return the casettes. There is no charge of any kind, including postage in the USA, (outside the USA, please send postage).

The Newsletter contains much useful information about Yaesu equipment, including operation, modification, and servicing. Back issues are available through 1972 when the Club was first organized by N4ML. Recordings of all back issues are being made and will be available on the same basis when completed.

More information about the Club can be obtained by writing to N4ML, Box 15944, West Palm Beach, FL 33406 or listening to The Fox Tango Net, on Saturdays, 14.325 MHz beginning at 1700 UTC.

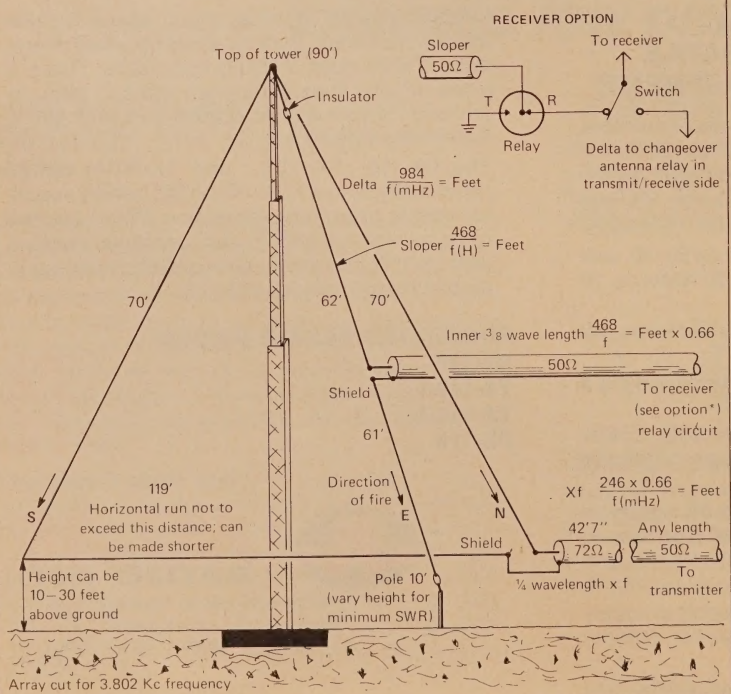

• The Foundation For Amateur Radio would like to announce the 1978 winners of the six scholarships which it administers.

The John W. Gore Memorial Scholarship ($750) to: Alicia Ann Moore, WB9LAD. The Richard G. Chichester Memorial Scholarship ($750) to: Katherine Hevener, WB8TDA. The QCWA Silent Key Memorial Scholarship ($500) to: John P. Georges, WA2MYU. The Young Ladies Radio League (YLRL) Scholarship ($300) to: Elizabeth K. Riemer, N7IT. The Radio Club of America, Inc. Scholarship ($250) to: James S. Storey, WB9NIO. The Edwin S. Van Deusen Memorial Scholarship ($250) to: David A. Newmyer, WB0NLA.

These scholarships were open to all amateurs holding at least an FCC General class license or the equivalent. This year applications were received from 24 states and Canada.

Information regarding the scholarships to be awarded next year will appear in the May 1979 issues of the major amateur radio publications.

• The Society of Wireless Pioneers will hold their annual Christmas CW QSO Party, Dec. 16-17, 1978. Suggestions or additional information about the Party as well as information about the Society, can be obtained from Party Coordinator, Bill Willmot, K4TF, 1630 Venus St., Merritt Island, FL 32952.

Shown with accessory touch tone pad

800 channels in the palm of your hand

Tempo presents the S1 SYNCOM...the world's first synthesized 800 channel hand held transceiver

This amazing pocket sized radio represents the year's biggest breakthrough in 2-meter communications. Other units that are larger, heavier and are similarly priced can offer only 6 channels. The SYNCOM'S price includes the battery pack, charger, and a telescoping antenna. But, far more important is the 800 channels offered by the S1. The optional touch tone pad shown in the illustration adds greatly to its convenience and we have available a 30 watt solid state power amplifier designed to give the SYNCOM S-1 the flexibility of operating as a mobile and base station as well.

SPECIFICATIONS

Frequency Coverage:	144 to 148 MHz
Channel Spacing:	Every 5 KHz
Power Requirements:	9.6 VDC
Current Drain:	17 ma-standby 400 ma-transmit
Batteries:	Ni-cad battery pack included
Antenna Impedance:	50 ohms
Dimensions:	40 mm x 62 mm x 165 mm (1.6" x 2.5" x 6.5")
RF Output:	Better than 1.5 watts
Sensitivity:	Better than .5 microvolts

SUPPLIED ACCESSORIES

Telescoping whip antenna, ni-cad battery pack, charger.

OPTIONAL ACCESSORIES

Touch tone pad, tone burst generator, CTCSS chips, Rubber flex antenna.

Price . . . $349.00 (or with touch tone pad . . . $399.00)

Tempo also offers a complete line of solid state power amplifiers, pocket receivers, the FMH-2, 5 & 42 portables, the VHF/ONE PLUS mobile transceiver, and the FMT-2 & FMT-42 remote control mobile transceiver. All available from Tempo dealers throughout the U.S. Call or write for full information.

Presenting a Revolutionary New Concept:

The HV-5 Dual-mode Antenna

The Omega-T HV-5 incorporates all of the features of our proven HV-3 triband 80/40/20 meter vertical. In addition it provides 10 and 15 meter coverage using balun-fed horizontally polarized V-dipoles as the antenna top-hat. Thus, the optimum polarization for DX is provided on all five bands. This, plus the following features, make the HV-5 the finest 5 band antenna ever offered to the amateur:

- **Performance** - The entire 30 foot top-loaded structure is utilized on 20, 40, and 80 meters, providing greater bandwidth and gain compared to typical trap verticals. Gain for exceeds that of verticals on 10 and 15 meters.
- **Power Handling** - Full legal power, SSB and CW.
- **Construction - Self supporting 6061T-6 extruded pipe—up to ¼″** wall thickness; stainless steel hardware and dipoles.
- **Ease of Installation** - Quick assembly and erection using tilt-up base mount to a pipe or post. Requires only a ground rod ground system at most locations.
- **Band Coverage** - All 5 bands provided with single transmission line feed—no switching required; broad bandwidth, 10 through 40 meters; 80 meter resonance easily changed at base matching unit in seconds; HP-2 plug-in matching unit available for 160 meter operation.
- **Value** - Model HV-5-$259.90; Model HD-2 for 10 and 15 meters only (same as HV-5 but less HP-F base matching multicoupling unit)-$209.95; HV-3-$169.99; HP-2 for 160 meters-$39.95. All items UPS shippable. Prices F.O.B. Richardson, Texas. See your amateur dealer or order direct.

DXpedition...The Ultimate Fantasy

Clipper ships sailing to foreign shores. Sixteen amateurs primed for adventure, coming together as the first group in 20 years to set foot on the remote French Island, Clipperton. Their goal: 30,000 QSO's in just 7 days.

If you're like most of us, a rare DXpedition is more a dream than a reality, but the Clipperton Linear Amplifier from DenTron brings the thrill of a DXpedition to you.

The Clipperton-L™ was inspired by the famous DXpedition on which 3 MLA-2500's were used. We built the Clipperton with 4 rugged, economical, 572 B's in the final to provide a full 2KW PEP on SSB and 1KW CW on 15 through 160 meters. With features like hi-lo power selector for equal efficiencies at 1 or 2 KW, a power transformer that is vacuum impregnated, wide spaced tuning and loading capacitors, built-in ALC and an improved whisper-quiet cooling system, the excitement of crashing a pile-up can be yours.

Clipperton-L suggested price $599.50.
FCC type accepted.

THE SWITCH IS ON!

Not only is the big move to switch to the Wilson Mark Series of Mini-Hand-Held Radios, but now the switch is on the Mark!

Wilson Electronics, known for setting the pace in 2m FM Hand-Helds, goes one step beyond!

AT NO EXTRA CHARGE: all Mark Series Radios now will include a switch for you to control the power of operation. This will enable you to use the high power when needed, then later switch to low power to conserve battery drain for extended operation.

IN ADDITION: all Mark Series Radios now have an LED Battery Condition Indicator conveniently mounted on the top plate. A quick peek will reassure you of a charged battery in the radio.

Wilson hand-helds have been known world-wide for exceptional quality and durable performance. That's why they have been the best selling units for years.

Now the Mark Series of miniature sized 2-meter hand-helds offers the same dependability and operation, but in an easier to use, more comfortable to carry size . . . fits conveniently in the palm of your hand.

The small compact size battery pack makes it possible to carry one or more extra packs in your pocket for super extended operation time. No more worry about loose cells shorting out in your pocket, and the economical price makes the extra packs a must.

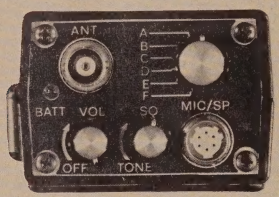

– NOW SWITCHABLE –

MARK II: ≅ 1 & 2.5 watts

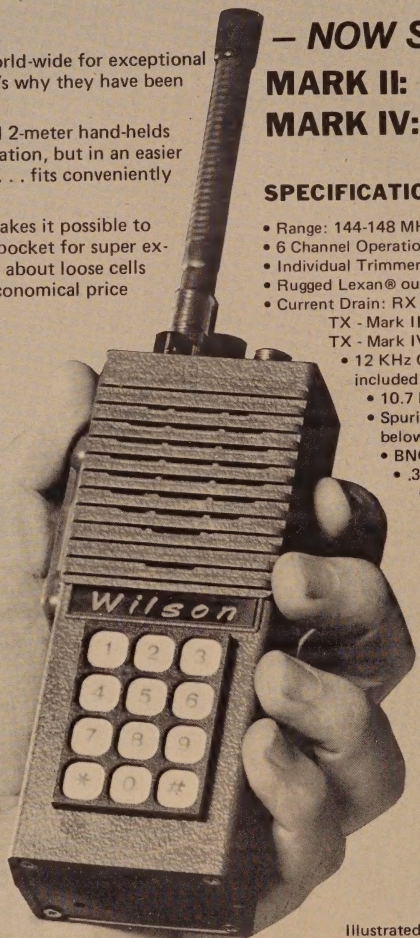

MARK IV: ≅ 1.5 & 4.5 watts

SPECIFICATIONS

- Range: 144-148 MHz
- 6 Channel Operation
- Individual Trimmers on TX and RX Xtals
- Rugged Lexan® outer case
- Current Drain: RX 15 mA
  TX - Mark II: 500 mA
  TX - Mark IV: 900 mA
- 12 KHz Ceramic Filter and 10.7 Monolithic Filter included.
- 10.7 MHz and 455 IKz IF
- Spurious and Harmonics: more than 50 dB below carrier
- BNC Antenna Connector
- .3 Microvolt Sensitivity for 20 dB Quieting
- Uses special rechargeable Ni-Cad Battery Pack
- Rubber Duck and one pair Xtals 52/52 included
- Weight: 19 oz. including batteries
- Size: 6" x 1.770" x 2.440"
- Popular accessories available: Wall Charger, Mobile Charger, Desk Charger, Leather Case, Speaker Mike, Battery Packs, and Touch Tone™ Pad.

Conveniently located on top of the radio are the controls for volume, squelch, accessory speaker mike connector, 6 channel switch, BNC antenna connector and LED battery condition indicator.

Illustrated is Wilson's BC-2 Desk Top Battery Charger shown charging the Mark Series Unit or the BC-4 Battery Pack only.

Optional Touch Tone™ Pad available.

To obtain complete specifications on the Mark II and Mark IV, along with Wilson's other fine products, see your local dealer or write for our Free Amateur Buyer's Guide.

Maximum Legal Power... ALPHA Style!

It's yours in these great new powerhouses from ETO

There are many so-called "Maximum Legal Power" linear amplifiers on the market. Why do so many knowledgeable amateurs, after checking out (or even owning) other makes, ultimately choose ALPHA?

Well, "maximum legal power" can be misleading . . . it doesn't tell the whole story. Most manufacturers' ratings assume that amateur service is inherently intermittent, so terms such as "continuous" and "100% duty" may be meaningless unless explicitly defined. The result can be a power transformer or tube going up in smoke during a long operating period.

But every ALPHA amplifier is explicitly rated to run a full 1000 watts of continuous, average DC power input, in any mode, with No Time Limit (NTL).

You could leave your ALPHA **(any ALPHA)** all day with a brick on the key, at a kilowatt input (or at 2 KW PEP input, two tone SSB) without hurting it. In fact, you could leave it for weeks: last year we ran a standard ALPHA 76 key-down at a kilowatt for **18 days** without ill effect.

That's "Maximum Legal Power" . . . ALPHA style.

PLEASURE OF OWNERSHIP . . . ALPHA STYLE!

The pleasure of owning and using a new ALPHA is now even greater. There's rugged, handsome new metalwork . . . refined metering and push-button control systems . . . improved bandpass circuits in the no-tune-up models. One model combines the conveniences of no-tune-up operation **and** full CW break-in. Another brings ALPHA POWER to 6 meters.

ENGINEERING AND CRAFTSMANSHIP . . . ALPHA STYLE!

These new ALPHA models are pleasing to the eye . . . but the real beauty is **inside,** where engineering and craftsmanship tell the story. The husky components and basic circuitry are the same ones that kept the ALPHA 76 and ALPHA 374 so amazingly free of major failures.

WARRANTY PROTECTION . . . ALPHA STYLE!

Other manufacturers give you just 90 days' warranty protection on their linears. Now ETO extends the famous ALPHA warranty to **TWO YEARS — EIGHT TIMES AS MUCH PROTECTION** as the industry standard! Tells you something about ALPHA quality, doesn't it?

The new ALPHA 76A series is FCC type-accepted and available now. For details, descriptive literature, and fast delivery on a great new ALPHA, see your dealer or contact ETO direct.

And ask for a copy of our free guide, *"Everything You Always Wanted To Know About (Comparing) Linears . . . But Didn't Know Whom to Ask."*

ALPHA – Sure you can buy a cheaper linear . . . But is that <u>really</u> what you want?

MODELS 5075-D & 5075-LF For Dipole Antennas Net Wt. 7 Oz.

WORLD'S FINEST BROAD BAND BALUNS 1:1 Or 1:4 RATIO

Kirk Broad Band Baluns are designed for matching an unbalanced line, such as coaxial cable, to a balanced antenna to produce a symmetrical wave form of equal intensity from the current cycle.

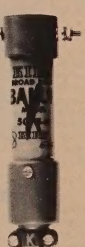

Kirk Baluns provide the greatest breakdown insurance by use of mylar insulation between the tough poly thermaleze winding and the Ferrite Core and a final dip coating of low dielectric impregnation. Handle peak power of 2000 watts provided ratio error is low.

Unique in design, Kirk Baluns are produced in two distinctive models: One for Dipoles and one for Beam Antennas.

NET PRICE $14.25

Application Frequency Coverage & Power Ratings For The Various Models Shown Below

Model HF3V - - Automatic bandswitching 80-20 meters.

May also be used on 10 meters with low VSWR. Same rugged construction as models HF5V-II and HF4V-II. Will not operate on 15 meters without a tuner, but specifications are otherwise identical to those of model HF5V-II except as noted below. Comes complete with mounting post, base shunt inductor for d.c. grounding, RG-11/U matching section, and connectors for PL-259 and any length of 50-53 ohm cable.

Shipping weight: 10 lbs./4.5 kg.

Height: 25 ft./7.5 meters

$72.00

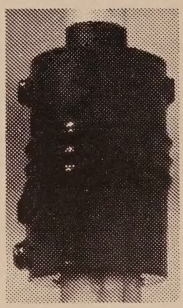

Model HF4V-II - - Automatic bandswitching 40-10 meters.

Entire radiator length is active on 40, 20 and 10 meters (full size quarter-wave resonance on 15 meters). Same construction and 40-10 meter specifications as model HF5V-II except as noted below. Comes complete with mounting post, base shunt inductor for d.c. grounding, RG-11/U matching section, and connectors for PL-259 and any length of 50-53 ohm cable.

Shipping weight: 9 lbs./4 kg.

Height: 25 ft./7.5 meters.

$72.00

$94.00

Low-profile antennas for mobile home parks and other restricted height areas! Same quality construction and 80/40 meter resonator circuits as used in the larger HF models; traps for 10 and 15 meter operation, but entire radiator length is active on all other bands. Both models complete with mounting post, base shunt inductor for d.c. grounding, and socket for PL-259 coax plug. May be ground or roof/tower mounted.

ELECTRICAL AND MECHANICAL SPECIFICATIONS:

Model HF5V-S - - Automatic bandswitching 80-10 meters.

Shipping weight: 9 lbs./4 kg.

Height: 16 ft./4.8 meters

Power Rating: legal limit SSB/C.W. 20, 15 and 10 meters; 1200 W PEP/500 W C.W. 40 meters; 500 W PEP/250 W C.W. 75/80 meters.

Feedpoint impedance: nominal 50 ohm all bands.

VSWR at resonance: 1.5:1 or less all bands.

Bandwidth for VSWR of 2:1 or less: 10 meters - - 1500 Khz; 15 and 20 meters - - entire band; 40 meters - - 150 Khz; 75/80 meters - - 30-50 Khz.

Wind survival rating (unguyed): 80 m.p.h./128 km.p.h.

Model HF4V-S - - Automatic bandswitching 40-10 meters.

Shipping weight: 8 lbs/3.6 kg.

Height: 14 ft./4.2 meters

Except for operation on 75/80 meters, all other specifications are identical to those given above for the HF5V-S.

$68.00

HF5V-S **HF3V** **HF4V-II** **HF4V-S**

the super-compact

alda 103

only 3¼" high x 9" wide x 12½" deep • less than 8¼ pounds

ALDA 103, the trim little powerhouse with incredible performance for the price! ALDA 103 provides a full 250 watts PEP input for SSB operation, and 250 watts DC input for CW. And when it comes to performance, ALDA 103 is the hottest little transceiver going — all solid state, totally broadbanded and super-stable VFO.

Ideal first transceiver for brand new novices! You'll want a full-capability CW/USB/LSB unit with all the power and performance you can use. ALDA 103 gives you 250 watts DC input for CW, the maximum allowable power for your novice license. When you upgrade to technician, you've got 2 bands for CW operation. And with your general license, just plug in your mic and use the ALDA 103's full 250 watts PEP on SSB!

Perfect second or mobile unit for seasoned hams! If you're looking for a super-sharp, compact unit to use in your car or boat, ALDA 103 will live up to your expectations. Absolute worst case sensitivity 0.5 uV for 10 dB S+N/N — a must for mobile operation. Receiver audio output of 3 watts minimum — another must. Also, very low receiver power drain of only 5.5 watts — that's 0.4 amps at nominal 13.8 VDC including power for dial and meter lamps!

Attention Novices and 15 meter fans!
Now introducing the Alda 103-A — operating 80-40-15 meters.
Contact your local dealer or the factory for details — prices shown below.

GENERAL SPECIFICATIONS

Semiconductors:	39 diodes, 23 transistors; 11 integrated circuits
Power Requirements:	Nominal 13.8 VDC input at 15 amps, negative ground only
Power Consumption:	Receive — 5.5 watts (includes dial and meter lamps); Transmit — 260 watts
Dimensions:	3-1/4" high x 9" wide x 12-1/2" deep (82.55 mm x 228.6 mm x 317.5 mm)
Weight:	8-1/4 lbs. (3.66 kg)

PERFORMANCE SPECIFICATIONS

Frequency Range:	80 meter band — 3.5 to 4.0 MHz 40 meter band — 7.0 to 7.5 MHz 20 meter band — 14.0 to 14.5 MHz
Modes:	CW; USB; LSB
RF Input Power:	SSB — 250 watts PEP nominal CW — 250 watts DC maximum (adjustable)
Transmitter:	
Antenna Impedance:	50 ohm, unbalanced
Carrier Suppression:	Better than −45 dB
Side-Band Suppression:	Better than −55 dB at 1000 Hz
Distortion Products:	Better than −26 dB
AF Response:	500 to 2500 Hz
Spurious Radiation:	Harmonics better than −45 dB below 30 MHz; better than −60 dB above 30 MHz
Frequency Stability:	Less than 100 Hz drift per hour (from a cold start at room temperature)
Microphone:	High impedance 3000 ohm
Receiver:	
Sensitivity:	Better than 0.5 watts audio output for 0.5 μV input
Signal-to-Noise Ratio:	Better than 10 dB S+N/N for 0.5 μV input
Image Ratio:	Better than −60 dB (typical with respect to 0.5 μV input: 80 meters — −130 dB; 40 meters — −100 dB; 20 meters — −75 dB).
IF Rejection:	Better than −70 dB (typical with respect to 0.5 μV input: 80 meters — 110 dB; 40 meters — 80 dB; 20 meters — 75 dB).
Intermodulation Intercept Point:	Better than 10 dBM
Selectivity:	2.5 kHz — 6 dB; 5.0 kHz — 60 dB
Audio Output Power:	More than 3 watts
Audio Distortion:	Less than 5% at 3 watts

$495

including microphone and mobile mount, too.

OPTIONS & ACCESSORIES

Noise Blanker — Model No. PC 701 ..... **$29.95**

100 kHz and 25 kHz Dual Crystal Calibrator — Model No. PC 801 ..... **$14.95**

Portable Power Supply — Model No. ALDA PS 115: average duty 15 amp unregulated; input — 115/230 VAC, 50/60 Hz; output — 13.8 V nominal at 15 amps **$79.95**

Heavy Duty Power Supply — Model No. ALDA PS 130: output — regulated 30 amp at 13.8 VDC; input — 115/230 VAC, 50/60 Hz **$149.95**

alda communications, inc. 215 Via El Centro Oceanside, CA 92054 (714) 433-6123

ALDA 103 is completely manufactured in the U.S.A.

A VERY IMPORTANT ANNOUNCEMENT FROM MOR-GAIN

WORLD'S LARGEST SPECIALISTS IN THE DESIGNING, DEVELOPING AND MANUFACTURING OF "NO COIL, NO TRAP" ANTENNA SYSTEMS.

multi-band HF communications antennas – half size · full performance

We're Pleased to Introduce Two New Models Specifically Designed for the Novice or Technician

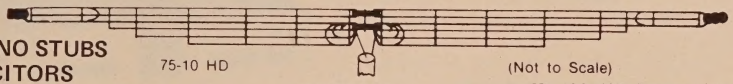

80-10HD(N/T) ... 69' overall length for 80/40/20/15/10 meter coverage $84.50

80-40HD(N/T) ..... 69' overall length for 80/40 meter coverage $63.75

No antenna tuner required. Completely factory assembled and tuned specifically for the novice/technician bands. Both models can be easily re-tuned for higher license class allocations in just a few minutes.

● *There is no better antenna at any price . . . W9QIO* ● *I had a Mor-Gain antenna and liked it extremely well . . . K4JMR* ● *The antenna has worked out well with very good reports . . . W2TVK* ● *I can only give glowing reports about it . . . WA2IRN* ● *I have used these fine antennas before and see no reason to change now . . . W6BF* ● *It has given me excellent service and results . . . W6CZS* ● *I believe I have "sold" your antenna to almost every ham I have talked to . . . W4AHN* ● *Its performance here far surpasses any other antenna that I have had . . . WA5GGS* ● *For several years I have used the Mor-Gain and have been very satisfied . . . K2TSD* ● *Am letting everybody know that it has been doing a good job for me . . . VE2VW* ● *The antenna is performing just beautifully . . . W8WDZ/6* ● *My 75-40 has performed beautifully and I'm very happy with it . . . WB8DMB* ● *Another chap said he had also used it and that it was the greatest . . . W4NSP* ● *I do not hesitate to recommend the antennas to others . . . K0SPR* ● *I heard a ham extolling the virtues of your antenna . . . WB0PTM* ● *I worked a station last night and the Mor-Gain was doing quite a job for him . . . WA3TCV*

NO TRAPS, NO COILS, NO STUBS NO CAPACITORS

MOR-GAIN HD DIPOLES . . . ● One half the length of conventional half-wave dipoles. ● Multi-band, Multi-frequency ● Maximum efficiency - no traps, loading coils, or stubs. Fully assembled and pre-tuned - no measuring. no cutting. ● All weather rated - 1 KW AM, 2.5 KW CW or PEP SSB. ● Proven performance - more than 15,000 have been delivered. ● Permit use of the full capabilities of today's 5-band xcvrs. ● One feedline for operation on all bands. ● Lowest cost/benefit antenna on the market today. ● Fast QSY - no feedline switching. ● Highest performance for the Novice as well as the extra-class op.

EXCLUSIVE 66 FOOT, 75-10 METER DIPOLES

● All models above are furnished with crimp/solder lugs. ● All models can be furnished with a SO-239 female coaxial connector at additional cost. The SO-239 male coaxial cable connector. To order this factory installed option, add the letter 'A' after the model number. Example: 40-20 HD/A. ● 75 meter models are factory tuned to resonate at 3950 kHz. (SP) models are factory tuned to resonate at 3650 kHz. See VSWR curves for other resonance data.

No. 16 40† Copper Weld wire annealed so it handles like soft Copper wire - Rated for better than full legal power AM/CW or SSB-Coaxial or Balanced 50 to 75 ohm feed line - VSWR under 1.5 to 1 at most heights - Stainless Steel hardware - Drop Proof Insulators - Terrific Performance - No coils or traps to break down or change under weather conditions - Completely Assembled ready to put up - Guaranteed 1 year ONE DESIGN DOES IT ALL; 75-10HD - Only $12.00 a band!

Model	Bands (Meters)	Price	Weight (Oz/Kg)	Length (Ft/Mtrs.)
40-20 HD	40/20	$49.50	26/.73	36/10.9
80-40 HD	80/40 ½ 15	57.50	41/1.15	69/21.0
75-40 HD	75/40	55.00	40/1.12	66/20.1
75-40 HD (SP)	75/40	57.50	40/1.12	66/20.1
75-20 HD	75/40/20	66.50	44/1.23	66/20.1
75-20 HD (SP)	75/40/20	66.50	44/1.23	66/20.1
75-10 HD	75/40/20/15/10	74.50	48/1.34	66/20.1
75-10 HD (SP)	75/40/20/15/10	74.50	48/1.34	66/20.1
80-10 HD	80/40/20/15/10	76.50	50/1.40	69/21.0

NOVICE LICENSE OPERATION. The MOR-GAIN HD Dipole is the ideal antenna for the new or Novice operator. As the Novice progresses to higher license classes, he can easily re-tune the HD Dipole to the new frequencies of his higher frequency privileges. The HD Dipole is thus a one-time investment. HD Dipoles are available for all Novice frequencies.

LEAST COST. Dollar for dollar, the HD dipoles are the highest performance, least cost multi-band antennas on the market today. For example: the 5-band 75-10 HD dipole costs less than $15.00 per band - an unbeatable low cost.

LIMITED REAL ESTATE. Where real estate for antenna installation is limited, the HD dipole is the ideal solution. Operation on 80/75/40 meters is now possible since the HD dipole is only half the length of a conventional half-wave dipole. For all around operation, the HD dipole will outperform any trap loaded horizontal or vertical dipole.

Above Models furnished with lug terminations. Cap-female SO-239 connector assembly – $3.75 additional. Include $2.50 for Shipping & Insurance with your order.

RTTY Can Be Easy!

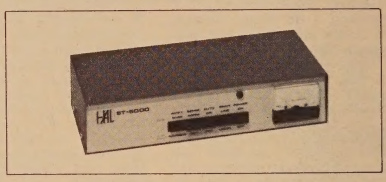

Have You Wondered . . .
What Owning a RTTY Station Would be Like?
Have You Thought . . .
About Finding Out but Didn't Know Who to Ask?

ASK THE GUYS AT HAL!

Our sales and service staff will be happy to assist you in your choice of RTTY equipment, answer questions about RTTY, and provide assistance if problems do arise. In addition, all HAL amateur RTTY equipment manuals can be purchased for $10.00 each for an advance look (applicable to future purchase of that unit).

Answers to common RTTY questions are featured in the center-fold of our new amateur radio catalog. Such questions as "What do I need?", "How do I hook it up?", and "What frequencies do I use?" are discussed. Technical points concerning RTTY pulses, FSK and AFSK, and high-tones vs low-tones are covered.

Write today for HAL'S new catalog and RTTY guide and discover how much fun RTTY can be.

There's a difference between home-building and home-brewing. Pre-packaged kits are home-built. Home-brewing involves your own research, design, finding of parts and components and, finally, putting the project together, testing it, debugging it and using it. Author Cebik describes the steps he took to home-brew his own transmitter.

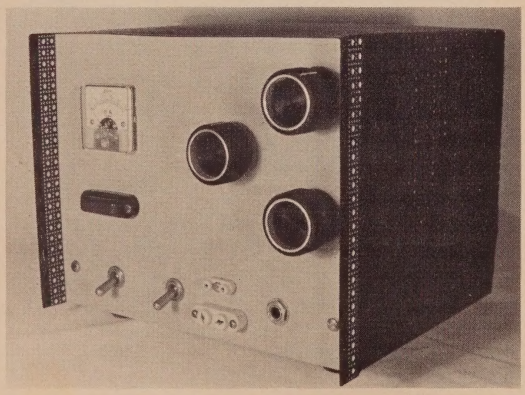

A First Step From Just Building to Home-Brew Design

A C.W. Low Power Transmitter for 80 Through 10 Meters

BY L.B. CEBIK*, W4RNL

The casual builder of electronic gear has been reduced pretty much to designing and constructing station accessories. First receivers and then transmitters became too complex (so we thought) for non-engineers to design. And specialized components are ever harder to find. So we weekend builders content ourselves with reproducing small IC projects we see in the magazines. In the process, we may be losing our ability to do basic design work, even at the amateur level.

*5105 Holston Hills Rd., Knoxville TN 37914

Overall view of the completed transmitter taken prior to the labelling of controls. Along the bottom of the panel are the AC switch, the crystal-v.f.o. switch, sockets for two types of crystal holders, and the key jack. To the upper left are a power on indicator light and a 0-100 mA meter; to the upper right are the band switch, p.a. tune control (top), and the loading control (botton).

Although I have built projects ranging in complexity up to a TTL Morse Code typewriter, one of the most useful has been the following small old-fashioned tube transmitter. It has been useful for me as a standby rig; more significantly, it has been useful in teaching new amateurs the very basics of amateur design. One may quarrel with the principles I list at the end of this article, but they—plus the simple rig that has several stages and really works—have been effective in convincing new amateurs that they can actually do things like this for themselves.

So you may read this piece from at least two perspectives: 1) If you have only reproduced circuits and never tried to design something to fill your special needs, then some of the ideas here will take you to the next plateau in home-brewing (and there are many others beyond this one); 2) If you like low power, reliability, tubes, or a chance to use up some of the older parts in your junkbox, then a project like this one may appeal to you.

The transmitter to be described here is a 10 watt, band-switching rig for 80 through 15 meters that has good c.w. capabilities and is, except for a v.f.o., self-contained. The general aim behind the construction of this rig was to put together a transmitter to serve as a standby for the regular station equipment and as a primary transmitter for having fun through the use of low power. These general aims produced the following design objectives: 1) simplicity of circuitry and construction, 2) reliability, 3) c.w. only operation, 4) low power (but above the QRPp level), and 5) multi-band operation. The design that evolved is sufficiently versatile that it can be reproduced in numerous physical arrangements while still yielding reliable results. It is not too difficult for the beginner, who may wish to omit certain "frills," such as the T-R circuit or

the auxiliary 12 volt supply. Nor is it too small a challenge for the experienced builder who needs or wants a transmitter of this order.

The requirements for simplicity and reliability in this transmitter strongly suggested the use of tubes. Although solid-state technology has replaced tube technology, we should not lose sight of the fact that *tubes still hold some advantages for the casual builder.* Our long experience with tubes has produced a number of simple and reliable circuits which can be reproduced with confidence so that the end product will perform as expected. Since this formed one of the goals of this project, tubes (ones I had on hand) were selected for the transmitter. It will not be too long, however, before solid-state circuits give us equal confidence, even at power levels above a few watts.

Basic Transmitter Circuits

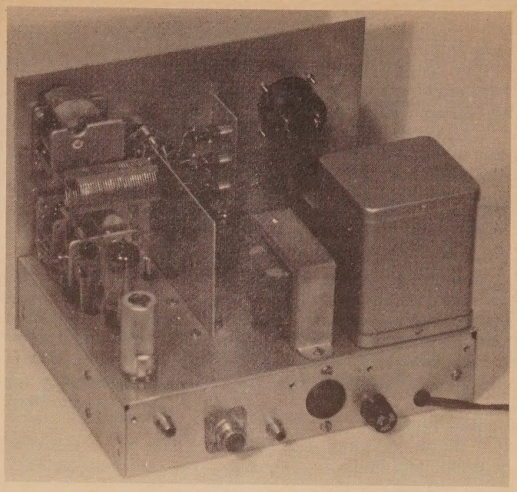

One should not think about this or any other electronics project exclusively in terms of the total package. Once the design objectives have been determined, the time has come to plan the work one circuit at a time. Planning is made easier in the present case because of our low power requirement and because we are using high impedance devices. We can work toward a maximum of simplicity without too much concern for problems such as driving power and impedance matching (except in matching the final amplifier to the antenna). If possible, we want to select the most basic circuits available without sacrificing performance standards.

The oscillator, for example, is a basic Pierce circuit. The output is untuned, eliminating the need for band switching in this stage. In addition, a simple s.p.d.t. switch converts the oscillator into an untuned buffer amplifier for a v.f.o. This particular frill can be omitted by anyone who is well stocked with crystals. The mica variable capacitor from the crystal socket to ground allows one to adjust the circuit so that even stubborn crystals will oscillate well and without chirp.

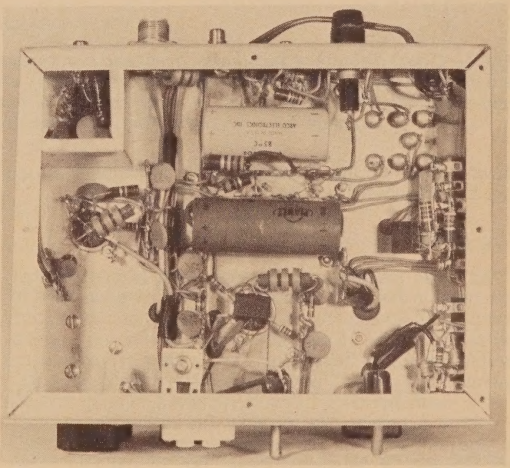

The multiplier stage again uses the most simple circuit available, a triode amplifier-multiplier. On 80 and 40 meters, the stage works straight through; on 20 and 15, it doubles and triples, respectively, with enough efficiency to drive the final amplifier. The only limitation is that the stage is not a good quadrupler, so 10 meters is omitted from the rig. In order to achieve a simplicity of another order—simplicity of tuning—the output of the multiplier uses slug tuned coils in a band pass arrangement, and one setting holds good for the c.w. portions of the bands used. Thus, no multiplier tuning control is required. Some means of frequency determination is needed during initial testing to assure that the output of the multiplier peaks with a reasonable setting of the coil slug. If such a peak is not found, adjust the capacitor value of the tuned circuit. For mechanical simplicity, the oscillator and multiplier consist of the two triode sections of a 12AT7. If one checks the tube pin arrangement, other r.f. dual triodes can be used just as effectively.

The final amplifier uses a reliable old pentode, the 5763, in a very standard circuit. The use of the pentode, plus a minor bit of shielding, obviates the need for neutralization, even on 15. The output circuit is a standard pi network. Since the only available loading capacitor was a two section receiving variable, additional capacitance is switched in as needed with a slide switch accessible through a hole in the side of the cover. With a three section variable, one can omit the switch. The band switch used is a two pole, six position unit, with only four positions used. The shield bisects the unit. However, a three pole, four position switch would allow the builder to switch in the proper loading for each band, but will reduce the range of capacitance available on the lowest bands to compensate for unusual antenna loading conditions.

The power supply for the basic stages of the transmitter uses a 300 volt center tapped transformer with a bridge rectifier. High voltage for the 5763 passes through a choke input filter and puts 265 volts on the plate, just enough for 10 to 11 watts input. A lower voltage is drawn from the center tap, and with a capacitive filter, it places 195 volts on the oscillator and multiplier plates. Components for the power supply were obtained from surplus sources, so filtering is over-designed and more than adequate. An alternative circuit, using a full wave rectifier and a 500 volt center tapped transformer is

Quartering rear view of the transmitter showing major parts placement. At the extreme left is the 5763 and pi network output. The shielded tube belongs to the T-R circuit. Beyond the shield is the 12AT7 and the multiplier tuned circuits. Along the right edge of the chassis are the transformers for the 12 volt, -50 volt, and h.v. supplies, with the choke just left of the h.v. transformer.

General underchassis view of the transmitter. Power supply wiring is done on terminal strips along the right edge of the chassis and top (rear) central. Oscillator and multiplier wiring runs from the terminal strips to the tube socket lower (front) central. The final socket and terminal is to the left, with the T-R switch within the shield rear left. d.c. wiring is cabled between the tube sockets, and r.f. leads are either very short or are shielded.

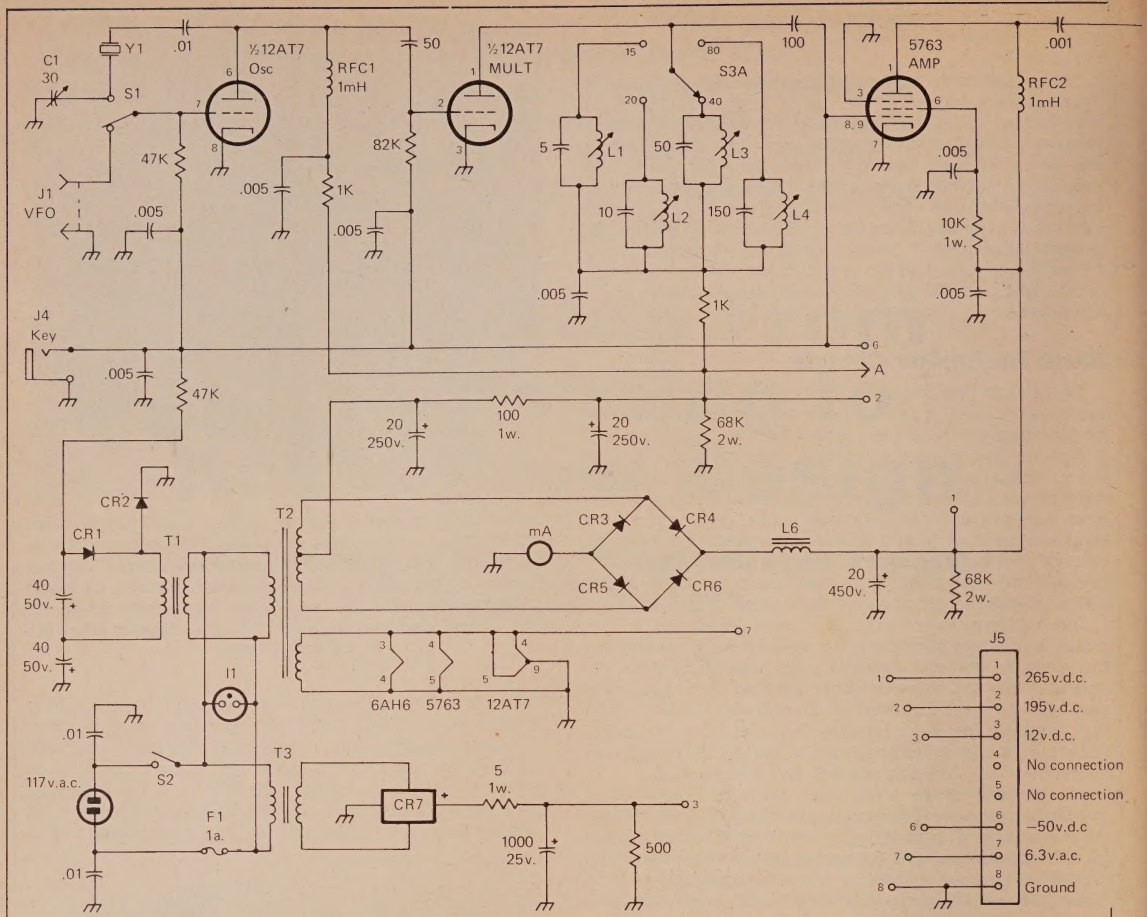

Fig. 1—Circuit diagram of the 10 watt, multiband c.w. transmitter. Decimal values of capacitance are in microfarads (μF) and are disc ceramic capacitors. Others are in picofarads (pF), except for capacitors with polarity marked, which are in microfarads and are electrolytics. Fixed values of resistance are ½ watt composition resistors except for those values where a higher wattage rating is shown. Every effort has been made to use easily obtainable components.

shown in fig. 2 in case a transformer similar to the one used here is not available.

The Extras

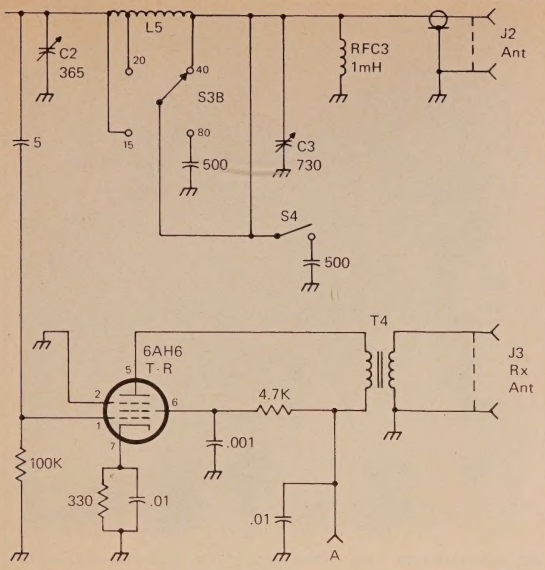

The basic transmitter is a modification of one originally described in the ARRL *Handbook*,[1] adding the multiplier for operation on 20 and 15, the switches for bandchanging, and the switch for v.f.o.-crystal operation. Several features considered important by this writer were added to improve the operation of the unit. They are optional, but recommended.

First, the transmitter is blocked grid keyed, through a source supplying something over -50 volts. The keying supply uses a voltage doubler circuit with the diodes and electrolytic capacitors oriented for negative voltage. The 24 volt transformer came from the junk box. Almost any -50 volt source will key the transmitter cleanly with little attention to shaping. However, one should still beware of clicks and be prepared to remedy them in accordance with the recommendations in the "Code Transmission" chapter of the *Handbook*. Blocked grid keying was selected because even at the low power used, cathode keying presents appreciable current across the key contacts. Key contact wear, the danger of shock, signal shaping problems, and spark filtering are all problems usually diminished by the use of blocked grid keying. In addition, it is also useful if one needs to key a v.f.o. Thus, I recommend it for all c.w. transmitters.

Second, the transmitter incorporates an electronic T-R circuit to permit break-in operation. It also eliminates the need for an antenna relay, thus cutting down the number of accessories needed to put the transmitter on the air. The circuit was taken directly from W1FBY's transmitter in October, 1971, *QST*,[2] and works well. Be sure, however, to shield the circuit as well or better than shown in the photos to prevent undue feed through to the receiver. Almost any small piece of ferrite may be used for the transformer in the 6AH6 output, one perfectly good version having been made from a piece of flat ferrite used in b.c. band receiver antenna coils.

Third, there is an accessory power plug in the rear of the chassis to power v.f.o.'s and other accessories. Not a great deal of power is available, but since the transmitter runs cool, 20 to 25 mils of current can easily be drawn from the accessory

[1] *A.R.R.L.* The Radio Amateur's Handbook, *1971, pp. 181 ff.*
[2] *Robert M. Myers, W1FBY, "A CW Man's Kilowatt," Part I.* QST, *October, 1971, pp. 15 ff.*

plug without harm. Because there was room on the chassis, a 12 volt d.c. supply was installed. The idea is to provide voltage for a solid-state v.f.o. to be used in conjunction with this transmitter while keeping the hum source—the transformer—away from the transistors. The arrangement works well, and regulation adapted to the needs of the particular v.f.o. used can be placed in the v.f.o. itself.

Fourth, the meter was added to read total current being drawn by the transmitter. By placing it in the negative lead of the bridge circuit, one can check the operation of all circuits, but no one of them individually. If one prefers, the meter can be placed in the plate lead of the 5763 to read just the final amplifier current. The choice depends upon what one considers most important. Since I use a s.w.r. meter to read relative power output, I adjust the plate tuning and loading to the point of maximum output (which matches well the point of plate current dip on all bands), so a reading of the precise amount of amplifier current plate current is not needed. In this rig the tube is being run well within its ratings. An output meter is recommended, but if one uses just a plate meter, loading the 5673 beyond 50 milliamperes is to be avoided.

Construction Notes

The entire transmitter fits on a 7 by 9 by 2 inch aluminum chassis. The photographs show the general layout. A 7 by 9 inch sheet was cut from 16 gauge aluminum to serve as the front panel, and a shell of Sears perforated aluminum was added for safety, shielding, and appearance. A bottom plate on the chassis, as well as four sheet metal screws along the top rear of the chassis, holds the shell in place. A two tone paint job (several thin coats of spray enamel) completes the job, with the exception of identification decals, which were added after the photos were taken.

The chassis and panel should have all holes cut and drilled before any parts are mounted. The tube holes were cut with chassis punches, the transformer's square hole was nibbled, and the meter hole was patiently cut with a drill mounted cutter. Holes for the crystal sockets (two are used to allow for both thick and thin pin crystals), toggle switches, and key jack were cut after the panel was fastened to the chassis in order to get the alignment exact. Then all the chassis hardware, transformers, and the choke were mounted.

The power supplies should be wired first. Wire them to the point of running leads to the terminal strips which serve each stage of the transmitter, but not to the tube sockets. This allows two important jobs to be accomplished before the r.f. stages are wired. First, the supplies can be tested to be sure they operate according to plan. Second, the power leads can be cabled neatly along the chassis edges and down the middle of the chassis between the 12AT7 and the 5763. Neatness at this point aids reliability by making servicing a great deal easier. The 12 and -50 volt supplies are wired to terminal strips mounted to one side of the chassis, while the main supply circuitry sits middle and rear on the chassis, behind the 12AT7.

Next, the r.f. stages should be added, one at a time. First, the oscillator should be wired and tested with any available crystal. RG175, thin coaxial cable, connects the v.f.o. input phone jack on the rear lip to the front panel switch. The mica trimmer is soldered to a terminal strip mounted to one of the crystal socket screws, and is accessible through a hole in the bottom plate. One setting should suffice for good operation with most crystals.

The multiplier stage requires that half the band switch be wired. The coils are mounted in a vertical row (80 at the bottom, 15 at the top) on a one inch wide strip of aluminum cut from an old chassis. Leads go through holes in the chassis (from the multiplier plate to the switch and from the power lead to the coils). A small plate cut from the same old chassis acts as a shield between the multiplier coils and the pi network of the final. Adjust each of the coils to peak in the center of each band used. A simple means of peaking is to put a small piece of wire in the grid pin of the 5763 (with no voltages connected to the 5763 socket). Using the station receiver S-meter, tune the coils to maximum reading.

Wire the final last. Since the plate pin of the 5763 is below chassis while the pi network is topside, leads pass through the chassis. The coil is mounted by its leads from the capacitors and the band switch. With four bands and thus five leads, mounting is secure, but may not be secure if fewer bands are used. Small coax connects the output of the pi network to the SO-239 coax fitting on the rear of the chassis. The slide switch was mounted vertically to the chassis top by bending one end of the metal mounting saddle at right angles. An r.f. choke at the antenna terminal provides safety in case the d.c. blocking capacitor fails.

Finally, wire the T-R circuit. A value of 5 to 8 pF to the grid of the 6AH6 should give plenty of coupling. The stage provides

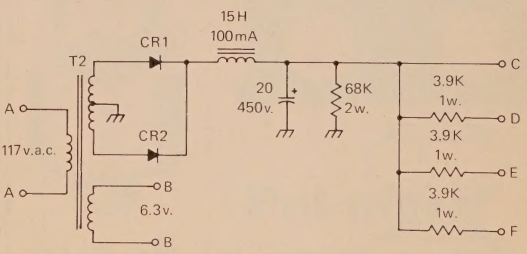

Fig. 2—Alternative main power supply.

- *B-B 6.3 volts a.c., connect as in fig. 1.*
- *C connect to junction of .005 capacitor and 10k/1 W resistor in 5763 plate-screen circuit.*
- *D connect to point A in fig. 1 (plate-screen circuit of 6AH6)*
- *E connect to junction of .005 capacitor and 1 mH r.f.c. in oscillator plate circuit (remove 1k resistor)*
- *F connect to junction of .005 capacitor and B+ end of tuned circuits in multiplier circuit (remove 1k resistor)*

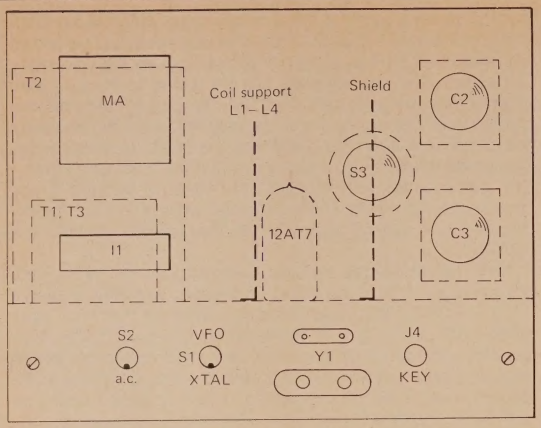

Fig. 3—Sketch of front panel layout with partial view of components mounted behind front panel. Solid lines represent parts on the panel; dashed lines represent parts behind the panel. Panel size: 9"x7".

receiver gain, and the position of the tap—between the blocking capacitor and the final amplifier tuning capacitor—aids selectivity. Add the shielding last, noting that the thin aluminum flashing is bent up and with a slight irregularity to make contact with the bottom plate.

Now add the knobs and start checking out the full transmitter on all bands. If all is well, put on the shell, wipe off the finger prints, and start operating.

Conclusion

A ten watt rig can be very effective, even in moderate QRM. Contacts have been made on all bands with this rig. I have

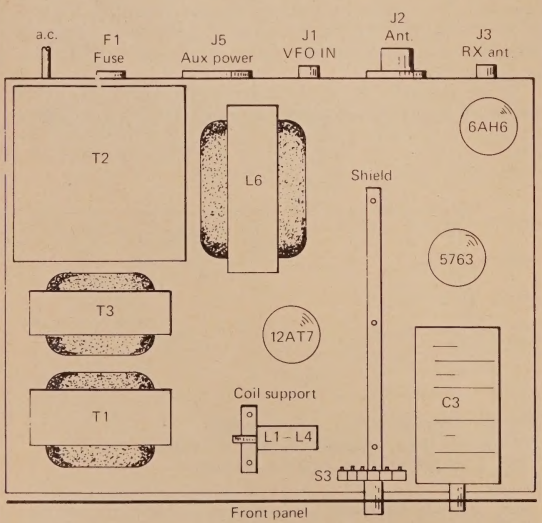

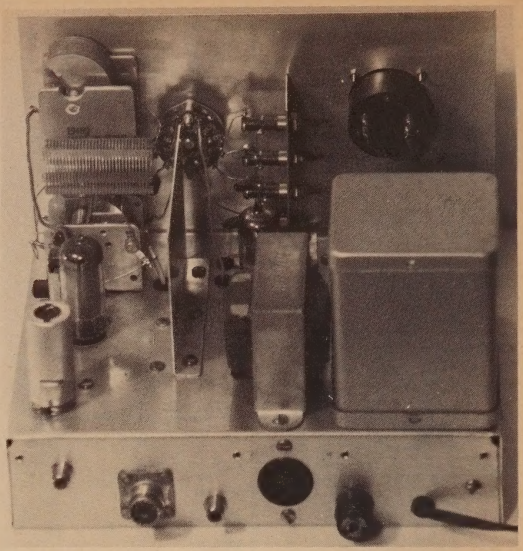

Fig. 4—Sketch of top chassis layout showing major components mounted on the chassis itself. C2 and L5 are mounted above C3. Below chassis, terminal strips are mounted on either side of the 12AT7 and on the shield side of the 5763 for component mounting. A shield of thin aluminum flashing surrounds the below chassis circuitry of the 6AH6, and the tube is shielded above chassis. Chassis size: 7"x9"x2".

An alternate rear view of the transmitter, also showing parts placement. Along the rear edge of the chassis are, from left to right, the receiver antenna jack, the antenna coax jack, the v.f.o. input jack, the auxiliary power socket, fuse, and line cord.

even had members of a state traffic net ask when I was going to use the rig when I was already using it. The difference between the received signal from this rig and the signal from the 100 watts I used for the regional traffic net is always less than two S units and mostly less than one S unit. Unlike working with milli-watt QRPp rigs, I do not have to worry about unanswered CQs or to look for only the strongest stations. I just wade in and start sending; the results are not noticeably less consistent than with 100 watts. That makes low power operation fun, and provides an intermediate stage in the move from

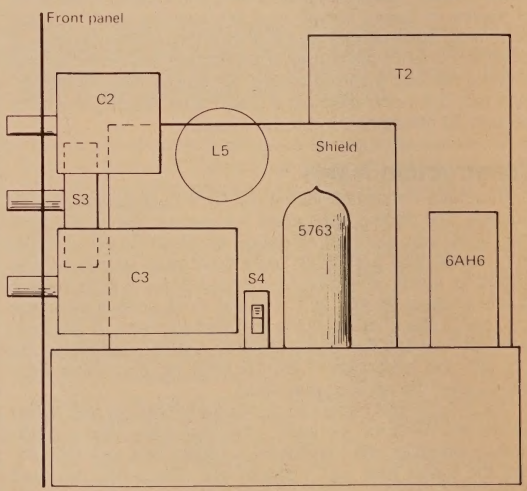

Fig. 5—Sketch of the right side of the transmitter showing the major components of the final amplifier. L5 is supported by its leads to S3 and to C2 and C3. The shield is mounted as closely as possible to S3, bisecting the two sections without shorting any terminals.

moderate power to full QRPp (less than 1 watt).

The simplicity of the circuits and of the operation of this rig make it one of the most reliable I have owned, and I have no hesitation about using it under emergency or field day conditions. In the end, however, perhaps it is less a rig to be reproduced exactly than it is a source of ideas for people who would like to start building.

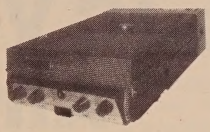

As small as it is, the rig is still a good exercise in the basics of design. All it takes to design a project is to 1) set down one's objectives clearly, 2) determine what kind of circuitry blocks will fulfill the objectives, and then 3) search the available literature for circuits that will do the job required in each block. Once this is done, 4) gather your parts, 5) plan your layout, and then 6) build and 7) test a stage at a time. Occasionally, especially at steps 3) and 5), give attention to matters involving circuit interaction, whether that be a matter of drive power and impedance matching or a matter of shielding and isolation. These are good procedures to follow whether you are building a multi-function, multi-stage high power rig or a simple three tube transmitter like this one. QST

Parts List

C1	3-30 pF mica trimmer
C2	Single section minature variable, 365 pF (Miller 2111)
C3	Two section miniature variable, 365 pF per section (Miller 2112)
CR1, CR2	200 PIV, .5 A silicon diode
CR3-CR6	800 PIV, .5 A silicon diode
CR7	200 PIV, 2 A bridge rectifier
F1	1 A fuse, (Littlefuse 3AG)
I1	Neon panel lamp assembly with built in dropping resistor for 117 V AC
J1, J3	phono jack, single hole mounting
J2	female coax connector, SO 239
J4	open circuit phone jack
J5	octal tube socket
L1	3μH slug tuned coil (Miller 20A336RBI)
L2	5μH slug tuned coil (Miller 20A476RBI)
L3	9μH slug tuned coil (Miller 20A826RBI)
L4	13μH slug tuned coil (Miller 20A155RBI)
L5	31 turns, No. 20 wire, 1 inch diameter, 16 turns per inch (B&W Miniductor 3015), tapped at 16, 9, and 6 turns from the tube end for 40, 20, and 15 meters, respectively
L6	15 H, 100 mA filter choke
MA	0 - 100 milliammeter
RFC1-RFC3	1 mH r.f. choke, 100 mA rating
S1	SPDT toggle or slide switch
S2, S4	SPST toggle or slide switch
S3A, S3B	2 pole, 4 position rotary switch
T1	filament transformer, 24 volts, .5 A
T2	power transformer, 300 volts, center tapped, 100 mA; 6.3 volts, 1 A (Note: T2 was obtained from surplus sources; if a similar transformer is not available, the circuit for the main supply shown in Fig. 2 may be used with a 500 volt center tapped transformer, 6.3 volts, 1 A)
T3	filament transformer, 12 volts, 1 A
T4	20 turns, No. 24 enameled wire wound on a 1 inch long, ⅜ to ½ inch diameter ferrite core, with a secondary of 3 turns, No. 24 enameled wire over the cold end of the primary.
Y1	Fundamental-type crystal for 80 or 40 meters (International Crystal Mfg Co. or equivalent)

John Schultz comes up with the most interesting ideas. Here's one (or two) that can add flexibility to your test bench.

A Four-Digit, One-IC Voltmeter—Almost

BY JOHN J. SCHULTZ*, W4FA

A good frequency counter is one of the central items these days on any test bench. The instrument can be used alone for just frequency measurements or with accessory units for the measurement of other electrical parameters. This article presents an extremely simple accessory item that can turn anyone's frequency counter into a full 4-digit, digital voltmeter! The basic accessory requires only one IC and it will suffice for a wide range of applications. However, the basic circuit can also be expanded for greater accuracy and versatility.

*c/o *CQ*

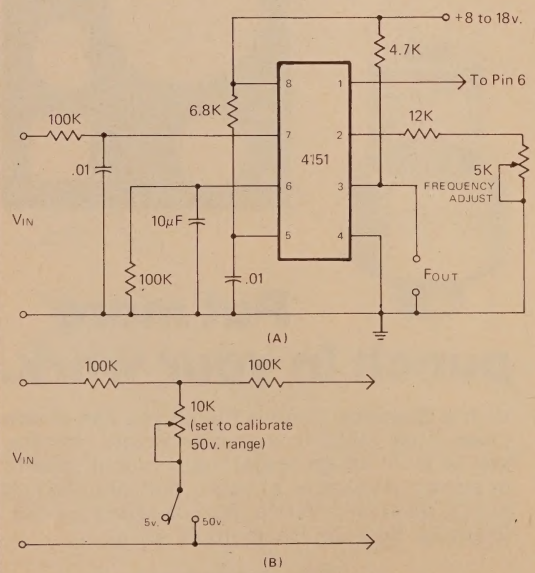

Fig. 1 — The RC4151 IC forms a simple voltmeter adapter for a frequency counter, as in (a). In (b) two voltage ranges can be added using a resistance divider.

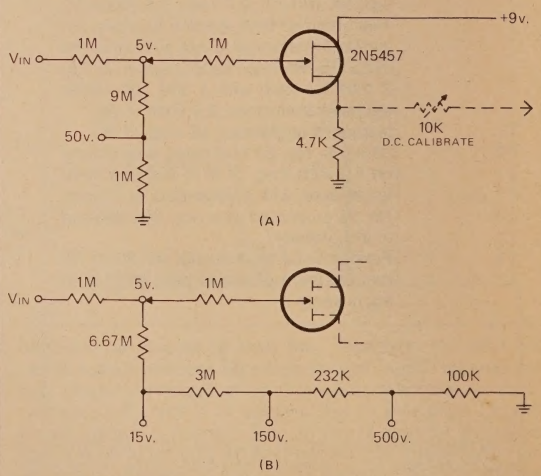

Fig. 2 — The input impedance of the adapter can be raised to 11 megohms by using an FET. Two possible voltage range divider networks are shown.

The heart of the unit is the Raytheon 4151 voltage to frequency converter IC. This is a low-cost, small, 8-pin package but it packs quite a bit of sophisticated IC technology inside. The output of the 4151 is a series of pulses of constant duration. The frequency of these pulses is proportional to the applied input voltage. For instance, if one applies an input voltage of from 0 to 10 volts, the output pulses will vary in frequency only from 0 to 10,000 Hz. The accuracy with which the output frequency tracks input voltage variations and how fast the output frequency changes when the input voltage is suddenly changed depends upon the IC's internal characteristics and also upon the external circuitry used with the IC.

Fig. 1(a) shows the most basic circuit for the 4151. Actually this circuit is complete in itself. By powering it with a simple 9 volt transistor radio battery, one has a complete accessory digital d.c. voltmeter adapter. The IC draws only abut 5 mA so such a battery will last quite a few hours. However, the maximum input voltage which can be handled is approximately 2 volts less than the battery supply voltage or, in this case, approximately 0 to 7 volts. One can raise the supply voltage to 15 volts if desired, and obtain the full input voltage range capability of 0 to 10 volts. A better solution might be to add the simple input voltage divider shown in fig. 1(b). In this case, one has two input voltage ranges available - 0 to 5 and 0 to 50 volts. By limiting the input to 5 volts one is assured of stable operation even when the battery voltage starts to decrease. The two voltage ranges cover almost all the voltage levels one is likely to encounter in transistorized circuitry and the resolution is more than adequate for almost any purpose. For instance, an input voltage of 0.468 will appear as 468 on the counter. An input voltage of 1.266 volts appears as 1266. The linearity error is about 1% and the response time is 135 milliseconds when the input voltage suddenly changes from 0 to 10 volts. The only adjustment that has to be done with the circuits is to set the trimpot for the highest frequency used. Using a known 5 volt source, set the trimpot to read 5000 on the counter with the adapter on the 0-5 volt range. In practice, the performance is better than that obtainable with most regular analog voltmeters.

The only possible drawback of the preceeding circuit is its relatively low input impedance. As it stands, it is perfectly usable for the great majority of purposes any d.c. voltmeter is used for on a workbench. Only when dealing with FET's or other very high impedance circuits will the input impedance prove a problem. In this case, a simple FET circuit can be used before the 4151 as shown in fig. 2(a). This will raise the input impedance to 11 megohms. The circuit of fig. 2(a) provides for only two input voltage ranges but one could, if desired, add a complete attenuator network as shown in fig. 2(b) to cover voltage ranges to 500 volts.

Once one has the basic d.c. digital voltmeter adapter working, it is possible to add all sorts of additional circuitry to it in order to achieve multimeter performance. It is a moot point, however, as to whether it is worthwhile doing so. The basic adapter is a very functional, accurate device for its purpose. But by adding a lot of additional circuits one could well end up with a hodgepodge unit of doubtful accuracy.

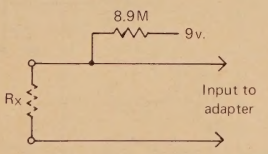

Fig. 3 — A very simple ohmmeter circuit can be added which is intended only for approximate resistance checks. An s.p.s.t. switch can disconnect the 9-volt supply when the adapter is used for its original function.

The only "add-on" feature that has proved of value in practice is a very simple ohmmeter feature. When using the adapter to check some circuitry it became very annoying to have to use another instrument to check the basic resistance of component. So, the basic ohmmeter circuit of fig. 3 was added to adapter. The circuit has all sorts of disadvantages and is *not* intended to be accurate. But it still has some usefulness for basic ohmic checks. 100k ohms resistance and below will read out fairly well in kilohms (e.g. 99k reads as 99). But above 100k the readings become useful only for crude check (e.g., 1 megohm will read out as 625 indicating only 625k ohms). Other ranges can be chosen if one wishes to concentrate what little accuracy is available differently (e.g., resistances below 10k ohms) by changing the series resistance used with the battery.

The construction of the adapter should be done using a shielded enclosure. A highly recommended form of construction is one using a Bud CU-3000A minibox with female BNC connectors at both ends of the enclosure. The battery for the adapter can be housed in the enclosure and the enclosure is large enough to accommodate an on-off switch and a range switch, if the latter is desired. A polarity reversing switch for the input to avoid having to reverse test leads is also useful. Note that a d.p.d.t. center-off slide switch can be wired to control the battery and also switch to either the voltmeter or ohmmeter function. The BNC connectors allow versatility in that the adapter, using a male-to-male BNC, can be situated at the frequency counter input on the adapter hand-held as a test probe with a shielded interconnnecting cable to the frequency counter input. There is nothing critical about the internal wiring of the adapter and it can be done on a small piece of perforated board stock. If the adapter is used in a strong r.f. field environment it may be necessary to add a r.f. choke at the input to prevent erratic readings on the frequency counter.

After some experience in using the basic adapter and if one has need for a really precision voltage to frequency converter, it is possible to modify the basic circuit for precision operation. A modified circuit is shown in fig. 4. In this case only an additional op-amp is needed plus some modified component values. The linearity of this circuit is 0.2% and it has a much faster response time than the basic circuit. Two adjustments are available in this circuit to set both the high and low frequency outputs. Set the 5k pot for the desired output frequency with maximum input voltage and the 200k pot for zero frequency output with zero volts input. CQ

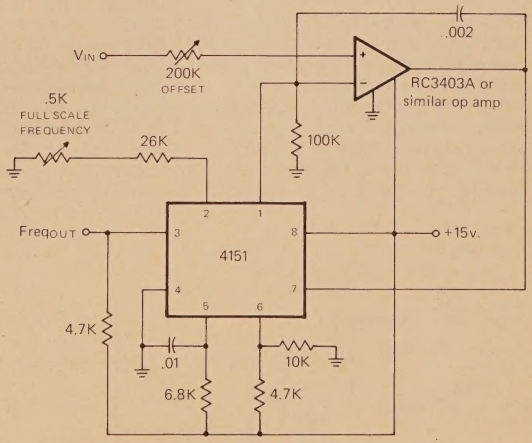

Fig. 4 — A more precise voltage-to-frequency converter can be formed by changing some circuit values and adding an op-amp.

A look at the technical side of things

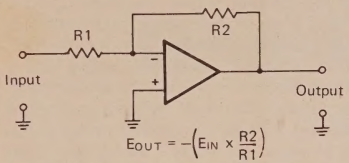

Fig. 1—Common inverting amplifier.

"The Operational Amplifier—Revisited"

One of the most versatile components available to the electronic experimenter is the operational amplifier—as we have seen in past columns. This device has been written on its applications alone! This month we would like to present several interesting applications that may be of use on your next project.

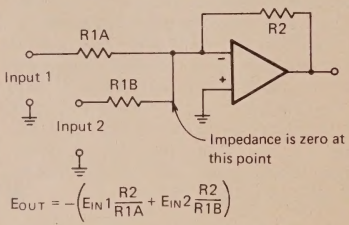

Fig. 2—Amplifier with two inputs.

Fig. 1 is a schematic diagram of the most common configuration for an operational amplifier, the inverting amplifier. Here, the output is equal to the input multiplied by the ratio of R2/R1. The output sign is reversed in this circuit. In our example, if R_1=1K and R_2=10K, applying +1 volt to the input will result in −10 volts at the output.

An important point to note is that the impedance between the actual inverting input point and ground is zero (or very nearly so). This means that the voltage present is zero and if two resistors are used for separate inputs, as in fig. 2, there will be no interaction between inputs. At the output however, the two inputs will be mixed in the proportion to their input resistors and R_2. This allows us to make a very simple mixer for all sorts of signals, For example, in fig. 3, we have a 3 channel audio mixer that can be used to combine any three audio signals to a common output. There is no interaction between channels and each input has its own level control. As a further refinement, a master level control is also provided (Rm).

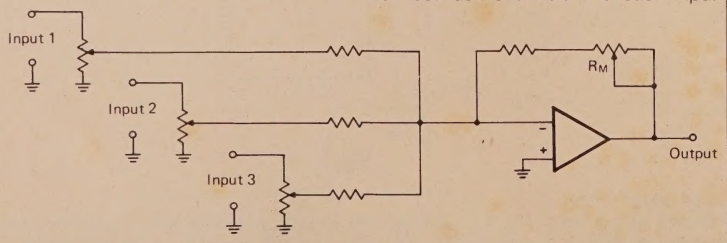

Fig. 3—Three channel mixer, discussed in text.

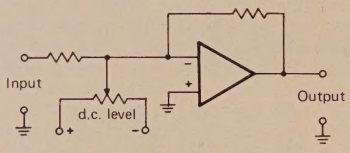

Fig. 4—Level changing circuit. The d.c. level of the output signal will be a function of the setting of the d.c. level pot.

By varying the value of the input resistor to each channel, we can also "scale" its input with respect to the others. This would allow both high and low level signals to be accommodated in the same mixer. Such a circuit should be useful to electronic music buffs or could also be used for communications purposes. One could, for example, easily combine voice identifiers and remote receivers for a two meter repeater transmitter.

If one input to the inverting circuit is charged to a d.c. voltage as shown in fig. 4, we have a simple d.c. level control.

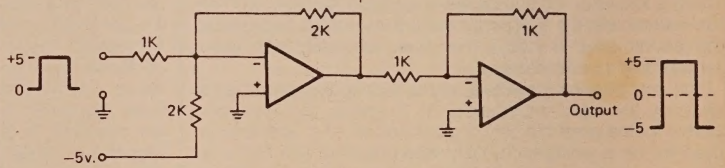

Fig. 5—Expansion of fig. 4 to a TTL to bipolar converter.

Since the output is always the sum of the two inputs, fig. 4 can take an a.c. signal, symmetrical at about zero and produce a signal that is all above zero, or below

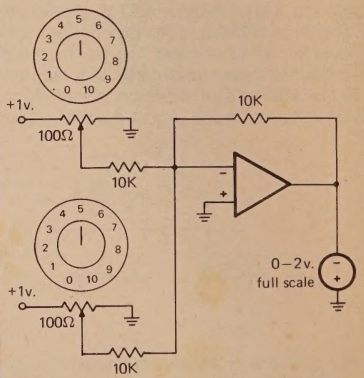

Fig. 6—Simple computing circuit showing a possible dial arrangement for the inputs.

CIRCLE 47 ON READER SERVICE CARD

zero as required. It can also be used to convert digital data such as TTL signals, to bipolar digital signals for telephone signal interfacing. A concept for a simple RS-232 type output driver is shown in fig. 5. Here a 5 volt TTL signal is converted to a ±5 volt signal. The gain of the digital channel is 2, giving 10 volts peak-to-peak, and the d.c. level of 5 volts assures ±5 volt outputs. This circuit inverts so a −1 inverting stage which has been added to restore the input polarity. The maximum speed of such a circuit is a function of the speed of the op-amp employed. Common 741 types will reproduce pulses in the tens of kHz. while faster ones, such as the LM318, will be necessary for operation around a megahertz or so.

All of the previous circuits are adding circuits. If the inputs were to be two d.c. voltages, the output would be the sum of the two voltages (up to the maximum that the amplifiers could deliver). This was the original intention for the op-amp—a computing circuit!

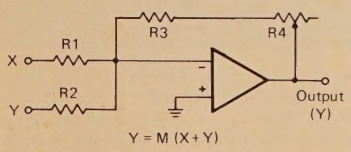

Referring to fig. 6, we have connected two potentiometers as voltage sources and an op-amp as a summer. Each input pot is linear and has a dial and knob calibrated from 0 to 1. The output is connected to a 0 to 2 volt meter. This meter will now indicate the sum of pot 1 + pot 2 to an accuracy only limited by the tolerances of the resistors used. If one pot is connected to a negative 1.0 volt supply, the circuit will now indicate the difference between the two pots. Finally, in fig. 7, we have a multiplier. Now, an output meter (0-10 volts) will indicate the product of the input and the setting of the feedback pot.

All of these circuits can be used to perform actual calculations if all dials and meters are properly calibrated. This concept can be employed by the experimenter to build analog calculators that can certainly supplement the popular digital calculators now being used by almost anyone. While not as accurate, these digital units, the op-amp calculator can be used with analog signals and an oscilloscope for true dynamic computations.

In conclusion, we have presented two such computing circuits as a simple guide to what can be done. Both are intended for illustration purposes and can probably be simplified.

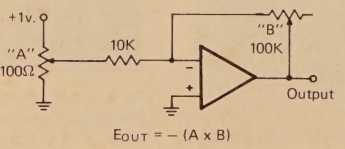

The first circuit, fig. 8, solves the equation $y+m(x+y)$. The addition $(x+y)$ is carried on in the normal way, and the multiplication, by varying the feed back resistors. Inputs x and y do not have to be d.c. levels but can be waveshapes if desired.

The second circuit solves a well known equation, Ohm's law. The meter reads the value of E and the two pots set R and I. If you know any two parameters you can find the third by simply manipulating the pots and reading the meter. CQ

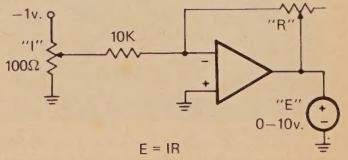

$Y = M(X+Y)$

Fig. 7—Simple multiplication circuit.

$E_{OUT} = -(A \times B)$

Fig. 8—Using an op-amp to solve an equation. The factor "M" is scaled by the setting of R_4.

$E = IR$

Fig. 9—Using an op-amp to solve a familiar equation.

Some of the most active and avid amateurs are members of the DXing community. However, all of their DX is limited to the confines of Mother Earth. Professor Horowitz has heard DX from the far reaches of outer space. Someday he hopes to have a QSO with intelligent life from afar. Read his fascinating story!

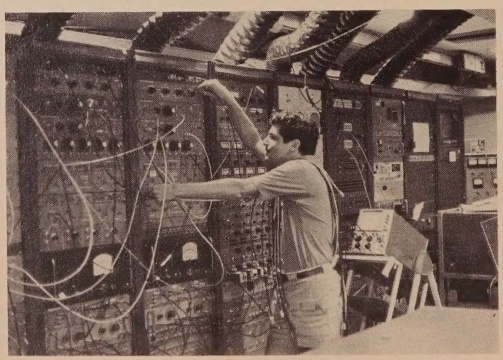

Chasing the Ultimate DX

BY PAUL HOROWITZ, Ph. D.*, W1HFA

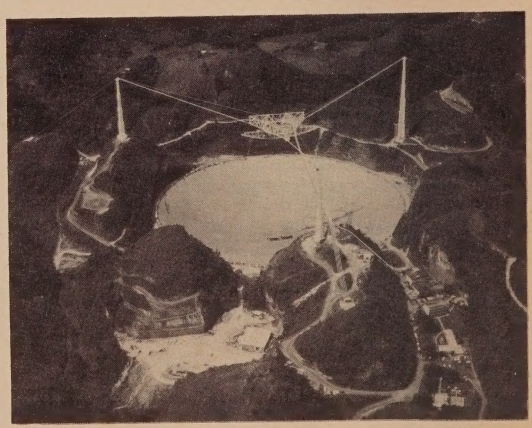

The last few decades have seen a resurgence in the belief that other intelligent civilizations almost certainly inhabit our galaxy. This new interest in CETI (Communication with Extra-terrestrial Intelligence) has been spurred by several developments, in particular the findings that 1) the formation of planetary systems and multiple stars is probably the rule (rather than the exception, as had earlier been assumed) in the process of star formation, and 2) complex organic building blocks necessary for life are formed in abundance when ultraviolet light and electric discharges are passed through a flask containing the simple constituents which are believed to have comprised the early atmosphere on earth. This means that a suitable habitat for life and a mechanism for its origin may exist near many of the 200 billion stars of our galaxy. Thus, our sun and planet are ordinary; the galaxy may be teeming with life and technology.

*Lyman Laboratory of Physics, Harvard U., Cambridge MA 02138

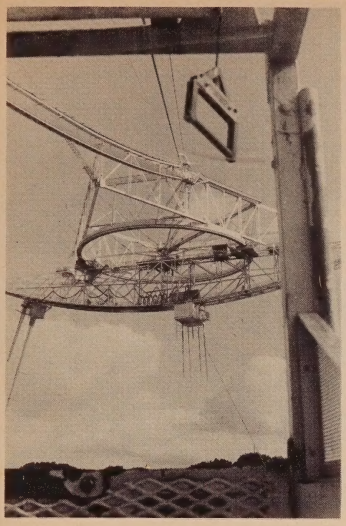

How might one snag this rarest of DX? Current opinion favors communication (not travel), probably at frequencies of 1 to 10 GHz on the basis of economy, i.e., most words per dollar. The classic paper on this subject is Cocconi and Morrison's publication in *Nature* in 1959, suggesting microwave communication near the frequency of the neutral atomic hydrogen "hyperfine" line at 1420.405751768 MHz (one of the most accurately known numbers in physics). This spectral line sticks out of the galactic continuum radiation like a giant frequency calibrator. It is the most abundant photon in the universe, it comes from the simplest and most abundant atom in the universe, and it is at a frequency close to the optimum for interstellar communication, given the spectrum of galactic background noise. Searches for signals at this frequency have been done in the last two decades, using large radio-

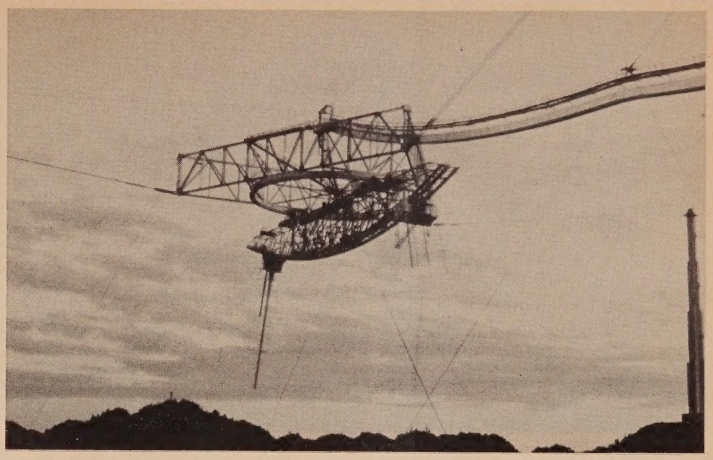

A view of the receiver room. The racks contain 100 separate stages so that a user can "custom patch" a receiver together. The author is in the process of doing just that.

An overall view of the Arecibo antenna. The dish is 1000 feet in diameter. The Arecibo Observatory in Arecibo, Puerto Rico, is part of the National Astronomy and Ionosphere Center, a national research center operated by Cornell University under contract with the National Science Foundation.

Left: A shot of the platform taken from the cable car. The emergency brake of the cable car can be seen hanging from the top. Above: A view of the platform and catwalk. A feed can be seen suspended from the lower left of the platform.

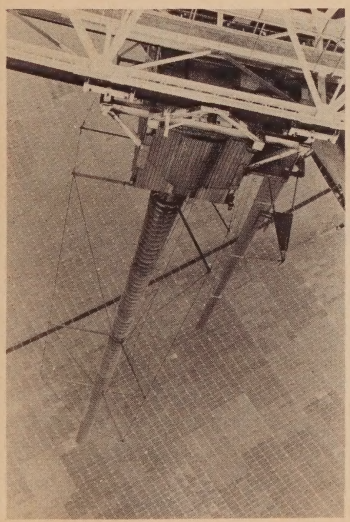

telescopes; these searches have looked, with resolution of about 1 kHz, for signals coming from the vicinity of nearby stars of type similar to our sun.

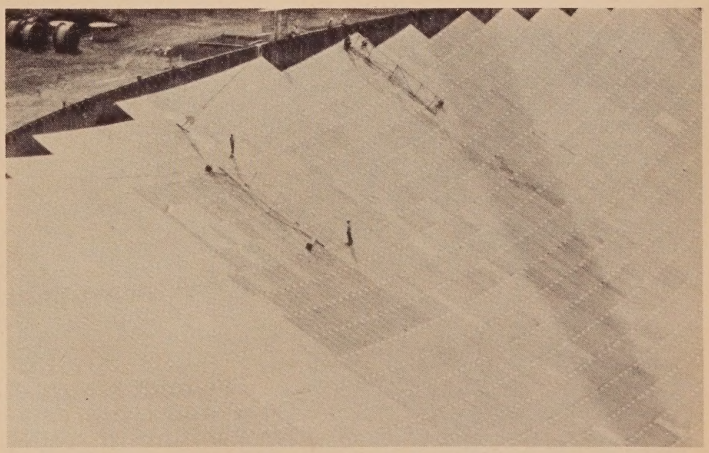

As any DX-er knows, c.w. gets you further, by virtue of narrower bandwidth. The Little Green Men on a faraway planet probably know this, too. With this in mind, the author decided to attempt the most sensitive search ever carried out for narrowband signals of extraterrestrial origin.

The first thing you need is a good antenna. The largest on earth is the spectacular 1000 foot dish at Arecibo, Puerto Rico. It sits in a giant "sinkhole" in Puerto Rico's Karst region, its 20 acre surface accurate to 5 millimeters, with a cluster of feeds on movable "carriage houses" suspended from an enormous 600 ton platform (a number of Arecibo's employees spend their entire workdays "upstairs"). It can steer 20° from the zenith in any direction, and has 68 dB gain at 1420 MHz. The author was lucky enough to obtain an invitation to search for signals with this magnificent instrument.

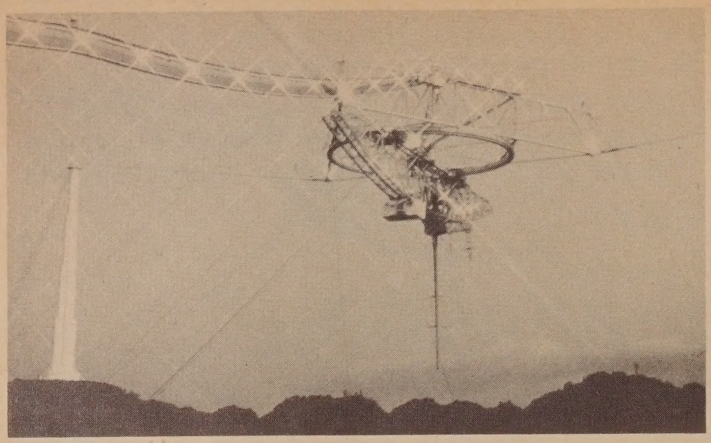

The next item to have is a good receiver. With these Arecibo is well-endowed, including maser and parametric amplifier front-ends, an assortment of mixers, oscillators, and IF's, and receiver "back-ends" consisting of baseband mixers, detectors, filters, correlators, and on-line digital processing equipment. In fact, they don't really have any "receivers"—what they have is a receiver "kit." You throw a few dozen BNC cables over your shoulder then connect up a receiver of your choosing from among dozens of pretty subassemblies (amplifiers, mixers, oscillators, filters, etc.). You soon develop skill at doing this rapidly, since it's done on your telescope time! The author usually managed to assemble this "receiver" in less than ten minutes.

What to look at, what frequency, what bandwidth? In this business one usually assumes "they" will be smarter than we are: The time that has passed since our civilization acquired radiotelescopes and radio technology is a thin slice of history indeed, and another technological civilization will likely have progressed beyond that slice. Given this likelihood, one can imagine a scenario in which the transmitting civilization sends

Left: This shot of a low frequency feed was taken by the author while leaning off the platform. In the photo a detail of the wave guide can be seen. Above: A view of workmen on the surface of the dish.

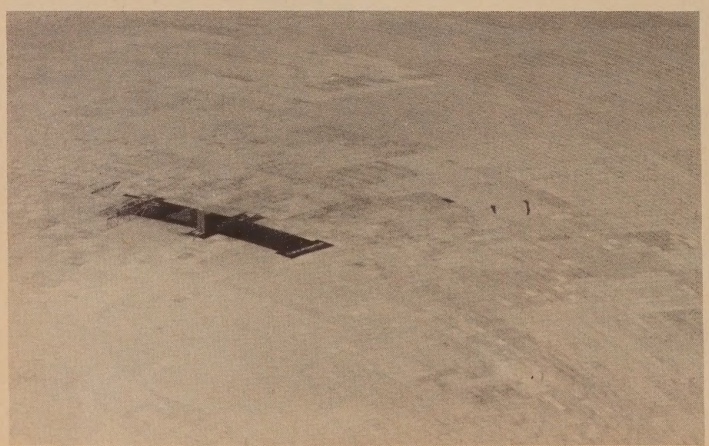

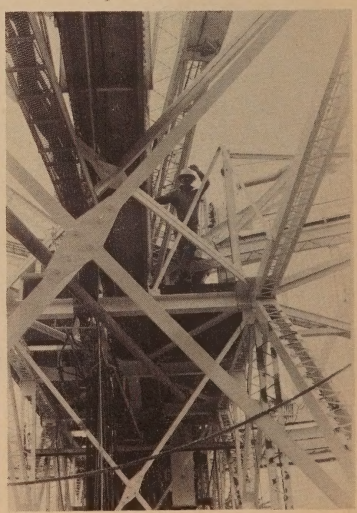

Above: A view of the platform and the catwalk as seen through the perforations of one of the dish's aluminum panels. Right: The size of the platform can be realized by comparing it against the man standing on it.

a narrowband beacon, directed at nearby stars known (to them) to be likely candidates for life, at a frequency such that it arrives in our solar system at the "true" hydrogen frequency. This they can do since they know our sun's velocity from solar line observations, and therefore can compensate for the Doppler shift. Our job, then, is simply to look at nearby sun-like stars at a receiver frequency corresponding to hydrogen frequency at the sun. Because of the earth's spin and orbit, this can be Doppler shifted as much as 150 kHz from the hydrogen frequency. At Arecibo, an on-line computer calculated the proper frequency every 20 milliseconds and set the local oscillator accordingly. The frequency must be set this often because the earth's spin causes the received frequency to drift at 0.15 Hz/second. The rubidium-referenced oscillators at Arecibo are stable enough to allow multichannel spectral analysis with resolution of 0.01 Hz at 1420 MHz; this is about the narrowest usable resolution, since fluctuations in the interstellar medium would spread any signal that much during its journey. The multichannel analyzer, incidentally, was synthesized by computer using the famous Cooley-Tukey "Fast Fourier Transform" operating on 131,072 sequential samples of the baseband mixer output. Total bandwidth was 1 kHz, resolved into bins of 0.015 Hz.

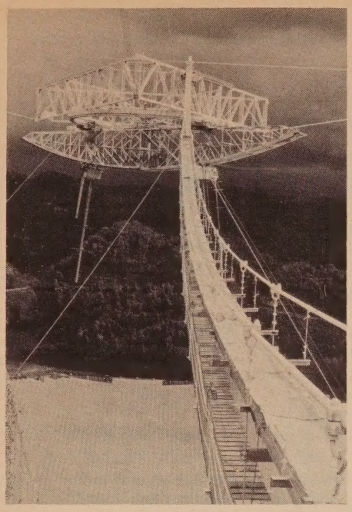

Previous searches have been plagued by false signals of terrestrial origin, which are, after all, "intelligent." A remarkable consequence of using ultra-narrow bandwith is that local interference is almost completely rejected. This occurs because the receiver, in a one-minute data-gathering run, is swept through about 10 Hz, smearing a narrowband interfering signal out over about 600 spectral channels. Only a narrowband signal which 1) is drifting in time in exactly the same manner as the receiver, and 2) remains on during the entire one-minute run, will appear in the final spectrum as a narrowband feature. For this reason QRM was never a problem during the search.

During three months at Arecibo (Jan-Apr, 1978) the author looked at all sun-like stars within 80 light years which are visible with the 1000 foot dish—185 stars in all. Sensitivity was 4×10^{-27} watts/meter^2 for easy detectibility in 1 minute (at least 10 minutes were spent on each star); this is at least 100

Above: A view of the surface of the dish. Right: Another view of a worker on the platform.

times more sensitive than any previous search, and corresponds to a signal with total power incident on the earth's disk of less than a millionth of a microwatt! An identical twin to the Arecibo dish, using transmitter power now available there (0.5 Megawatt, c.w.), would have been easily detected at 1000 light years distance.

Oh, the result, in case you hadn't guessed, was negative. But then, maybe this wasn't the season of their DX contest.

Bibliography

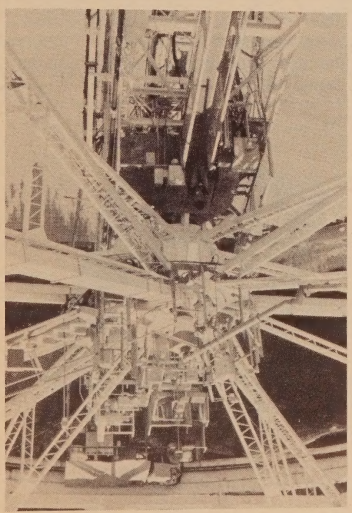

The Search for Extraterrestrial Intelligence. C. Sagan and F. Drake, *Scientific American,* May 1975, p. 80-89. This recent review, intended for the scientific layman, summarizes current thinking and includes a list of previous searches.

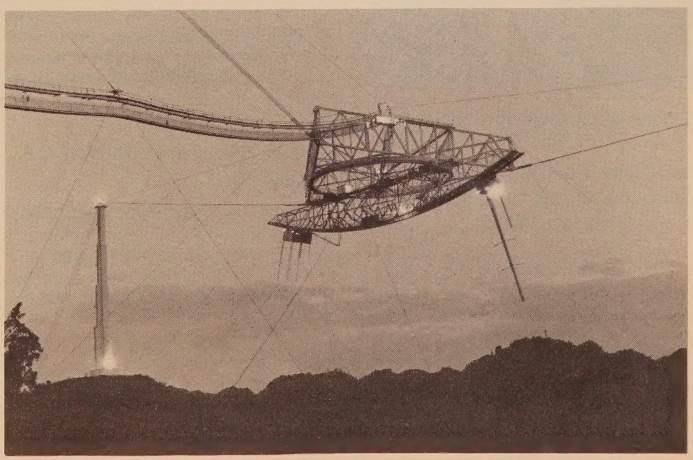

Intelligent Life in the Universe. I. S. Shklovskii and C. Sagan (Holden-Day, San Francisco, 1966. Now available in paperback from Dell). This Russian-American collaboration is the most comprehensive work on the subject, including much background material on astronomy and planetary evolution, the evolution of life, the possiblity of life in our solar system, and speculations on the probability of life near other star systems and possible means of contact. Almost no stone is left unturned in this broad-ranging and highly readable exploration.

Interstellar Communication. A. G. W. Cameron, editor (Benjamin, New York, 1963; available in paperback). A nice collection of original articles (including Cocconi and Morrison's) on this subject, though a bit out of date.

Communication with Extraterrestrial Intelligence. C. Sagan, editor (MIT press, Cambridge, MA, 1973; available in paperback). This interesting volume contains the lectures and discussions of the first conference on CETI, held in the Soviet Union in 1971. You'll find wilder speculation here than in a formal article or book.

Project Cyclops: A Design Study of a System for Detecting Extraterrestrial Intelligent Life. B. M. Oliver and J. Bil-

Above: Another view of the catwalk and platform. Left: An underside view of the platform showing the intricate construction.

lingham, editors (NASA Contract Rep CR114445, 1973; available from Dr. J. Billingham, NASA/Ames Research Center, Code LT, Moffett Field, CA 94035). This large paperback volume presents in great detail the background information and arguments relevant to the detection of signals form extraterrestrial intelligence, culminating in the design of the "Cyclops Array," 1500 dishes each 100 meters in diameter. Though this grandiose antenna may never be built, this volume (comparable to the Shklovskii and Sagan book in scope) is an authoritative reference, and makes very enjoyable reading.

The Search for Extraterrestrial Intelligence—SETI. P. Morrison, J. Billingham, and J. Wolfe, editors. (NASA Spec Publ SP419, 1977; available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, stock #033-000-00696-0). This paperback is the latest word on the SETI problem, resulting from a set of Workshops which many of the world's experts attended. It is a bargain at its GOP price.

Two recent articles in *Science:*

Extraterrestrial Intelligence: An Observational Approach. B. Murray, S. Gulkis, and R. E. Edelson, *Science, 199,* 485 (1978). A survey of the problem and previous work, and a call for further searches.

A Search for Ultra-Narrowband Signals of Extraterrestrial Origin. P. Horowitz, *Science, 201,* 733 (1978). A technical report on the author's search described in this *CQ* article.

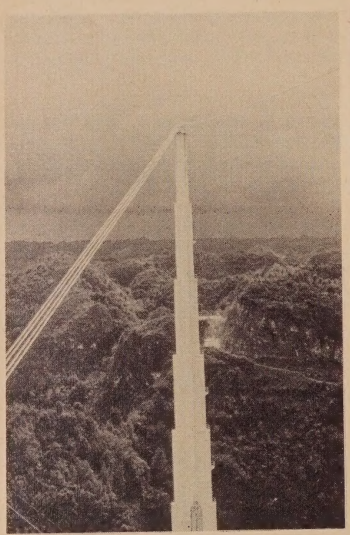

Many of the Arecibo Observatory people are amateurs. Among the staff are—

New Amateur Products

The Radio Amateur Antenna Handbook *by Bill Orr, W6SAI and Stuart D. Cowan, W2LX*

Here's a book that every radio amateur will be interested in. Every conceivable antenna commonly used by amateurs is described and discussed by our hobby's leading antenna "maven."

The book is immediately available from Radio Publications, Inc, Box 149, Wilton CT 06897. It sells for $6.95.

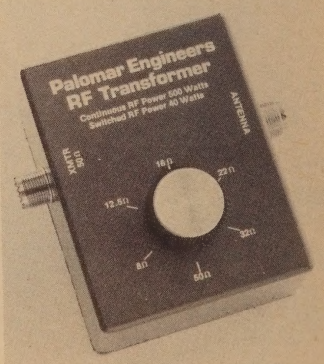

CIRCLE 54 ON READER SERVICE CARD

Palomar Engineers 500 Watt R.F. Transformer

Palomar Engineers has introduced a new broadband r.f. transformer. It matches vertical and mobile antennas to 50 ohm coaxial cable. Impedance values are switch-selectable at 8, 12.5, 16, 22, 32 and 50 ohms.

The transformer is mounted in a die cast aluminum case (4" × 5" × 2") and is fitted with SO-239 coax connectors.

The price is $35 plus $2 for shipping. For more information write to Palomar Engineers, P.O. Box 455, Escondido CA 92025.

WILLIAM I. ORR, W6SAI

Antennas

Design, construction, fact, and even some fiction

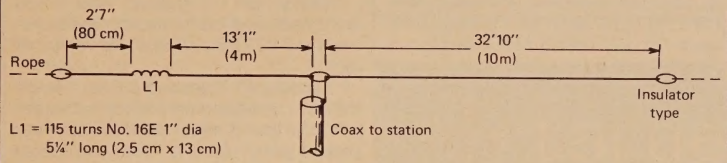

Fig. 1 — Short antenna tip beyond loading coil may be adjusted to move antenna resonance on 15 meter band. Antenna provides superior operation on both 15 and 40 meters. (Metric dimensions in parenthesis)

"Excuse me. I didn't know you had company". I closed the door to Pendergast's shack, but not too quickly to hear him call, "No, no! Come on in! I have a friend here I want you to meet". I entered the room. Sitting beside Pendergast at the operating table was a young fellow that I did not know. He had dark hair, a small beard and a quick and humorous look about his eyes. Pendergast rose and said, "I'd like you to meet a new radio amateur. Bill, this is Doctor Livingston I Presume. He's a dentist and just received his Novice license".

"Congratulations Doctor", I said shaking his hand. Doctor Presume grasped my hand and remarked, "You have been in Afghanistan, I see".

"A good point, Doctor", I replied. "And congratulations on your Novice ticket. Are you on the air yet?"

"Call me *Doctor Liv*", said my new friend. "No, I'm not on the air yet, but I soon will be. I was just chatting with Pendergast and I hope to swindle him into helping me put up an antenna".

Pendergast blushed with pride. "I'm always ready to help the humble beginner", he remarked.

"Pendergast, I love your humility", I said. "What do you have in mind for the good Doctor Liv?"

"Well, 15 meters is jumping these days. And 40 meters is always good for a local rag-chew. So I think that he should put up an antenna that would work on both bands".

"Agreed", I replied. "What do you have in mind?"

Pendergast thought a bit. "Well, how about a 40 meter dipole?

"That's resonant at the third harmonic, which is 15 meters. If Doctor Liv put up a 40 meter dipole, he could work both bands".

I turned to the good Doctor. "What kind of a rig do you have?"

"I just bought a *Kamikaze-200*. It's the new all-solid-state rig", He replied.

"Very nice"; I replied. "However, there's one problem. Most of the new solid state jobs don't like to work into any antenna system that has a high value of s.w.r. In fact, they protect themselves against high s.w.r. by a power reduction circuit. Thus: the higher the s.w.r. on the antenna, the less power output from the transmitter".

Dr. Liv frowned. "What's that got to do with using a dipole on its third harmonic?" he asked.

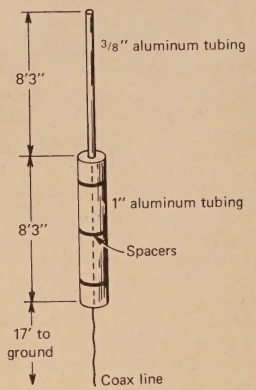

Fig. 3 — Vertical dipole for 10 meters. Shield of coax line is grounded to 1 inch tubing at center junction. Center conductor is attached to 3/8 inch whip. Insulating spacers hold coaxial line in center of lower section.

"Simply this. Third harmonic resonance isn't quite three times the fundamental frequency. Let's say you have a dipole that is cut to be resonant at 7.1 MHz. You might think the third harmonic resonance would be three times 7.1 or 21.3 MHz. However, this is not the case. The third harmonic resonance actually turns out to be 21.8 MHz. This is far enough in frequency from the Novice band at 21 MHz. to cause s.w.r. problems with some types of solid-state equipment. And even some rigs that have tubes in the final amplifier (supposedly immune to high values of s.w.r. on the antenna system) might develop loading problems under such a condition".

48 Campbell Lane, Menlo Park, CA 94025.

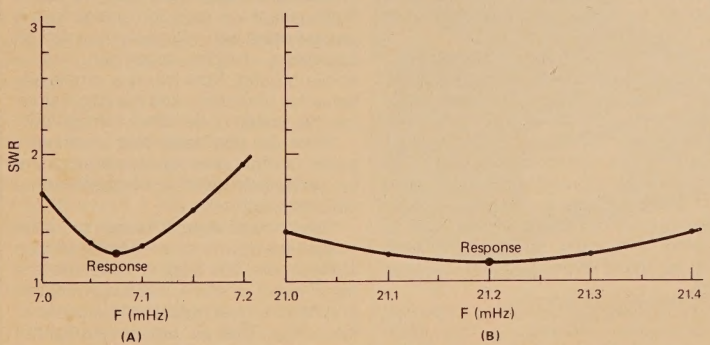

Fig. 2 — (A) Plot of s.w.r. on 40 meters. (B) Plot of s.w.r. on 15 meters.

"But I hear a lot of Novices on 15 meters that are using a 40 meter dipole", protested Pendergast.

"That may be so", I replied. "But there's a better way of doing the job that will provide operation on both 15 and 40 meters with very low s.w.r. on the transmission line"

With a flourish Dr. Liv produced a large, lined notebook.

"I'm taking your advice", he said with a smile. "Here's the start of my antenna notebook of good ideas".

"Well, this idea came from JA3CZV who wrote it up in the March, 1977 issue of *CQ-Ham Radio,* the Japanese amateur publication. Look at fig. 1. This is a 40 meter dipole with one branch shortened and tuned to resonance with a loading coil. The coil resonates the short side of the dipole to 40 meters but it upsets the current distribution on 15 meters to permit antenna resonance to occur at 21.2 MHz. instead of at 21.8 MHz. On 40 meters the s.w.r. readings for this antenna are below 1.6-to-1 across the c.w. band, rising to about 2-to-1 at 7.2 MHz. On 21 MHz., the s.w.r. is quite flat, running less than 1.4-to-1 across the whole band".

"Very interesting", said Dr. Liv, as he copied the drawing in his notebook. "Is there any adjustment to be made to the antenna?"

"If you want to move the resonance about at 40 meters, you trim or lengthen the short tip section after the coil", I replied. "Otherwise, leave it as it is".

"How do I plot a s.w.r. curve for this, or any other antenna?" asked the Doctor as he wrote busily in his notebook.

"All you need is an s.w.r. meter", I replied. "The little imported jobs that sell for under twenty dollars are just fine".

"I can see that you haven't been following the recent exchange rate between the dollar and the yen", observed Pendergast with a laugh.

I ignored the thrust. "The important thing to remember is that no adjustments to the transmitter, or changes in the length of the feedline, will affect the s.w.r. reading. The *only* thing that will affect the s.w.r. reading are changes made to the antenna. If you find that transmitter tuning, or changes to the transmission line affect the s.w.r. reading, then it is possible that something is wrong with the s.w.r meter or else you are measuring something else in addition to antenna parameters".

"I've heard from other Novices that you can change s.w.r reading by changing the length of the coaxial transmission line", observed Dr. Liv.

"You can change your *transmitter loading* by changing line length", I replied. "In fact, some fellows do just that. They cut short extension pieces of transmission line of various lengths and splice them to the main transmission line, thus changing the overall length of line between the transmitter and the antenna. And sometimes they find that a certain length of line loads the transmitter better than other lengths. This is very true, and it is a good technique to keep in the back of your mind when you run into loading problems. It is a quick and dirty means to load a transmitter that is working into a line having a high value of s.w.r. on it. But this sneaky trick doesn't change the *value* of the s.w.r. on the line, it merely changes the conditions of loading for the transmitter. If you are lucky, and hit the right line length, the transmitter may load up, regardless of the s.w.r. value. Now, that's not to be taken as a blanket statement! I'm only talking about *reasonable* values of s.w.r., say, less than 2-to-1. If you have a really high value of s.w.r. on the line, all bets are off and my statement is non-operative".

"That stunt doesn't always work", said Pendergast. It *usually* works with tube-type equipment that has both tuning and loading controls for the amplifier stage. By juggling line length, it is possible to get most pi-network tuned stages to load into a line having a reasonably high value of s.w.r. on it. And it is helpful with solid-state output stages, too. But many times it won't work on a solid-state rig, or if it does permit proper loading, the s.w.r. is still too high to prevent the transmitter from developing full output. And you can spend a lot of time looking for the "lucky" line length that may not exist!"

"Well, what can you do about it?", asked Dr. Liv. He reached in his pocket and took out the instruction booklet for his new *Kamikaze-200.* He thumbed rapidly through it and said. "Yes, here it is. It states that with an s.w.r. of 1.5-to-1 the output is 70 percent of normal and with an s.w.r. of 2.0-to-1 the output is 45 percent of normal. That's not so good. And as I understand it, every antenna is resonant at only one point in the band and the s.w.r. is lowest at that point. This means the s.w.r. is higher at other points in the band. Right?"

"That's right", I replied. "And this brings us back to the question you asked about running an s.w.r. curve for a given antenna. Let's take the antenna shown in fig. 1.

"You run an s.w.r. curve by measuring the s.w.r. at various points across the band. The s.w.r. meter instruction manual tells you how to make an s.w.r. measurement so I won't insult your intelligence by repeating that. It is common practice to make a measurement of s.w.r. every 50 kHz, starting at one end of the band and going to the other. On 10 meters, which is a rather wide band, the measurements may be made every 100 kHz. to save time.

"Write down the measuring frequency and also the s.w.r. reading. Then when you have gone across the whole band, you make up a graph. The s.w.r. measurements fall along the Y-axis and the frequency falls along the X-axis. Look at fig. 2. This is a plot of the s.w.r. measurements made for this Japanese antenna across the 40 meter band. Measurements were taken at 7.0, 7.05, 7.1, 7.15 and 7.2 MHz. Note that the curve is smooth and symmetrical. And note that the lowest value of s.w.r. falls between two of the measuring points".

Pendergast peered at the curve. "It looks to me as if the frequency of lowest s.w.r. is about 7.075 MHz.", he announced.

"That's right", I replied. "And if you went back and made another measurement at 7.075 MHz., that would verify this fact".

"I produced a second curve. "Here's the s.w.r. measurement of the same antenna on the 15 meter band. Points were plotted every 100 kHz. Note how broad the s.w.r. curve is. This is normal for an antenna working on the third harmonic".

"Have you ever though about using a vertical antenna?", asked Pendergast. "You can put up a triband vertical, or perhaps two separate ground planes. I like vertical antennas very much."

I reached into my desk drawer and brought out a bulky manuscript.

"This is a very interesting dissertation on vertical antennas", I said. "It is a military-sponsored investigation of the properties of vertical antennas for fixed-station use. Most of the information in the report is well known, but it brings out one important fact that has been overlooked these past few years, namely, that a vertical half-wave dipole can out-perform a ground plane antenna. The report summarized this fact by stating that an elevated dipole will improve low angle radiation by 3 dB to 5 dB over a ground plane antenna of equivalent height, and use of a vertical dipole is an attractive alternative to placing an extensive ground screen or radial system beneath a quarter-wave monopole".

"That sounds interesting", said Doctor Liv. "Do you have a practical example?"

"Look at the antenna in fig. 3", I replied. "This simple antenna provides more than 3 dB gain at low radiation angles than a ground plane with 40 radials mounted an equivalent height—seventeen feet—above ground. Now this is a simple antenna for 10 meters. And the dimensions can be scaled up for other bands, too"

"How do you feed this antenna?", asked Doctor Liv as he drew a picture of the vertical dipole in his notebook with a delicate touch.

"Well, if I was doing it, I would bring the coaxial line down inside the lower section of the dipole. It is easy to make spacers out of wood, or some insulating material, to space the coax right down the center of the tubing. That will prevent the field of the antenna from screwing up the proper

function of the coaxial line".

"Simple enough", said Pendergast. "Is there any magic height that the vertical dipole should be mounted above ground for best results?"

"The report had many charts of angle of radiation versus height of the dipole above ground. For best results the bottom of the dipole had to be a minimum of 0.5 wavelength above ground. Slightly better results were achieved at a height of 0.75 wavelength".

Pendergast frowned and said, "this is contrary to all published information on vertical dipole antennas. According to conventional wisdom, the higher the dipole above the ground, the less will be the low angle radiation".

"That's true", I admitted. "And that's one reason the investigation was run. It revealed the fact that when a vertical dipole is placed above the actual ground, which has mediocre conductivity, the radiation patterns are quite different from the patterns of a similar antenna placed above a perfect ground. And most theoretical studies and tests are done assuming a perfect ground. As you know, most tests are run on a v.h.f. antenna range which has a large copper sheet for a ground. But that isn't the way it is in true life. The best natural ground is sea water. But the conductivity of sea water is only a fraction of that of a copper plate. And the conductivity of soil is only a fraction of that of sea water. So the measurements made on an antenna over an ideal ground don't bear much resemblance to real life, where the antenna is mounted over lossy earth".

Pendergast breathed deeply. "Then all those pretty little pictures in the handbooks that show angles of radiation at various heights above ground just aren't true for antennas mounted above lossy ground?"

"I won't go so far as to say that", I rejoined. "This study only compares the performances of a ground plane antenna against a vertical dipole antenna. The study conclusively showed that the dipole out-performed the ground plane when both were mounted at least 0.5 wavelength above average soil".

"Well, I'll be dipped", said Pendergast. "Seems to me that the vertical dipole antenna is a lot easier to get up in the air than a ground plane with all those messy radials".

"Could be", I replied. "I hope some amateurs will try this antenna out and let me know their experiences with it. After all, the real proof is in how well the antenna really works. If this report is factual, I think we are in for some interesting antenna experiences!"

Doctor Presume shook my hand as he prepared to leave.

"Thanks for the bull session", he said. "I'll let you know how I come out with my experiments." CQ

target your signal with a Tailtwister™

*the Engineered Choice for Antennas Up to 30.0 Square Feet.**

The Tailtwister Rotor

- 138 Ball Bearings — unparalleled load capacity
- Triple Race — exceptional lateral control
- 1,000 in lbs. Torque — turns largest arrays
- Machined Steel Gear System — maximum life
- Machined Electric Wedge Brake — drift free communication

The Tailtwister Control

- Zener Regulated Meter — accurate locational guide
- User Controlled Brake — professional operation
- Snap Action Controls — extraordinary life
- Low Voltage Operation — complete safety
- Dual Transformers — meter circuit isolation

Only Cornell-Dubilier could bring you the Tailtwister, the results of over 30 years of heavy duty rotor manufacturing experience. This All American product offers you pinpoint control of antenna systems up to stacked six element dual polarized arrays. No other rotor blends the capacity, safety and ease of installation like the Tailtwister. Choose CDE, the standard of the world for better communications.

*When in-tower mounted, 15.0 sq. ft. free standing.

The ins and outs of the Washington scene

Government report details skywave interference to CB

The National Telecommunications and Information Administration, an agency of the U.S. Department of Commerce, recently released a report entitled "Effects of Local and Skywave Interference on CB Radio Range" (L.A. Berry; NTIA-Report 78-1). The results of the investigation indicated that if the current solar cycle is average to above average in intensity, and if CB usage does not decrease, the operational range for CB transmissions in cities with populations less than 100,000 could be one-half of its present value during the daylight hours of non-summer days for about three years at the peak of the sunspot cycle. The study also suggested that skip interference will probably not be a concern to users of the 27 MHz. band who reside in metropolitan areas with populations of more than one million.

Perhaps the most startling result of the study is that at the peak of the sunspot cycle the range of CB transmissions in sparsely populated rural areas may be only one-sixth of their present range. Since about one-third of the U.S. population resides in small cities and rural areas, it is readily seen that a significant proportion of CB operators will experience skywave interference of sufficient magnitude as to reduce their transmission ranges by 50% or more.

Given the above, it does not take much insight to realize that as skywave interference increases, more and more pressure could be placed on our elected officials in Washington to provide frequencies in the v.h.f. or u.h.f. band for CB use . . . that is, to provide access to frequencies where skip is no longer a concern. Needless to say, the 220 MHz. band would satisfy this requirement, and at this writing, proposals to allocate portions of this band to the Mobile (including CB) service are still very much alive.

*8603 Conover, Alexandria, VA. 22308

ARRL procrastinates on Washington representative

While the largest CB organization in the United Sates is strengthening its hand by moving its executive offices to the Washington, D.C., area, the American Radio Relay League has once again postponed the creation of a Washington office.

At the second meeting of the ARRL Board of Directors, held in 1978, a majority of the Board voted (Minute 76) to make the position description for a Washington representative, which had been prepared by the ARRL's President and General Manager, the task assignment of the Washington Coordinator. This vote followed a move by Director Egbert (Minute 66) ". . . to move forward in a positive and orderly fashion toward the establishment of a (Washington) Office;" Director Egbert's proposal, however, was nullified in Minute 76.

This action (that of delaying the creation of a Washington representative) is directly counter to the Board's instructions to the President and the General Manager, as stated in Minute 40 of the first meeting of the Board (January 1978). At that time, the Board instructed the President and General Manager to proceed immediately to establish the position of Resident Washington, D.C., Representative for the ARRL, and to seek a qualified candidate for this position.

It should be noted that Directors Gant, Holladay, McConaghy and Miller voted against the motion (Minute 76) to make the position description for the Washington Representative into the task assignment for the Washington Coordinator. Their vote, presumably, signaled support for the creation of a Washington office, and suggests, at the least, that four directors recognize the importance of ARRL representation in the Federal City.

CB'ers strengthen hand, move to Washington

The International CB Radio Operator's Association (CBA) recently announced that it has merged with the American Citizen Band Operator's Association (ACBOA/ALERT) to form the largest CB operator's organization in the United States.

According to Mr. Ron Hyden, Executive Director of CBA, the newly formed CBA/ALERT organization will enable both organizations to further their common goals. More specifically, these goals are:

to provide a strong, national-scale emergency volunteer network offering disaster assistance;

to increase educational activities with the goal of positive self-regulation by CB operators in cooperation with, and in adherence to, FCC rules and regulations;

to continue to work with federal authorities in eliminating radio-frequency interference (RFI).

The new organization, to be known as CBA/ALERT, will also cooperate with the Civil Defense Emergency Preparedness Agency and the American Red Cross to provide a comprehensive national network of CB volunteer operator teams to assist in the event of a regional or national emergency.

To strengthen the voice of CBA/ALERT, Mr. Ron Hyden also has indicated that he will move his office to Reston, Virginia, a suburb of Washington, D.C., where he will better be able to work with those federal agencies which impact on CB operations.

BILL WELSH, W6DDB

Novice

"How to" for the newcomer to Amateur radio

Sources of Aid for Prospective Amateurs

I have been writing this Novice column a short while but I have already become convinced that many readers are not Novices. Recent issues offered free copies of licensing course printed aids on subjects such as coaxial cables, sending and receiving DX QSL cards, and worldwide sources of code practice. About 300 requests were answered in two months with materials promptly sent to those supplying the usual large (10 by 12 inch) self-addressed and stamped envelopes. Approximately one-third of the requests came from amateurs listed as Novices in the present callbook or its supplement. More than half of the requests I received were from amateurs indicated to hold General or higher classes of licenses. I realize that some of the material offered may have been more interesting to those with a bit more technical background (and higher classes of licenses) than it is to Novices. Nevertheless, the response was extensive enough to be indicative of who reads this column, and it is not just Novices and aspiring Novices looking for help.

It appears reasonable that newcomers to amateur radio have very little to guide them to their limited sources of information. It also seems obvious that these Novices and aspiring Novices need the help and advice of established amateurs to get started as quickly and easily as is possible. I think that most amateurs do not communicate well with newcomers and it is hoped that this article will convince some amateurs to make an effort to be more communicative with Novices.

If you know someone who is a Novice, or who is preparing to be a Novice, try to imagine (or remember) just how strange and confusing the world of amateur radio is to a beginner. Don't make things worse by assuming the newcomer knows about the American Radio Relay League, ARRL Divisions, ARRL Sections, ARRL appointments, bugs, code speed rates (words per minute), *CQ* Magazine, Domestic/Foreign Callbooks, Domestic/Foreign postal rates, DX, FCC Rules and Regulations, FCC test procedures, *Ham Radio* and *H-R Horizons* magazines, International Reply Coupons, keyers, logs and logging, QSL bureaus (incoming and outgoing), QSL cards, *QST* magazine, shacks, signal reports, standard (ARL) messages, sticks (pencils), telegraph keys, telegraph mills (typewriters), *Worldradio News*, and *73* magazine. Make things easier for beginners by minimizing your use of amateur radio jargon and stating things in simple terms which can be understood by people who have no radio training. You'll do newcomers a very real service if you take the time to explain things in plain language. Please do not dazzle them with your jargon, because you may just be convincing them to try something else such as rock collecting or painting, in lieu of amateur radio.

I have instructed Amateur Radio Licensing Courses on a regular basis for a long time and I well realize how much material a newcomer must learn to become a licensed and active Novice. I am very appreciative of the recent boom in club licensing programs and I hope they will continue to flourish and improve. It is my belief that formal licensing courses provide prospective amateurs with a maximum amount of essential information with the least amount of wasted effort and time. Keep track of where and when amateur licensing courses are conducted in your area and pass this information along to anyone indicating an interest in becoming an amateur. It helps to keep course availability data with you at all times because it is liable to be wanted no matter where you go or what people you meet. It is advisable to know a specific person and telephone number to be contacted by those seeking formal licensing instruction. If you do not know where and when such courses are held in your area, simply advise prospective licensees to request this information from the ARRL, 225 Main Street, Newington, Connecticut 06111. The ARRL Club and Training Department does a good job of providing up to date information on this subject.

My major training effort has been directed towards club training but I realize that it is not always possible for aspiring amateurs to attend this type of group instruction. In these cases, it is often a

This is Rick Dittmer (WD9IRI) in his shack. Rick is a 24 year old USAF airborne radio operator based at Grissom AFB, Indiana. He earned WAS in the first few months he was licensed as a Novice and is working towards several DX awards. His SB-104A is used with an all-band vertical and dipole antennas.

CTV-8040	80/40/15	20'	$59.95

FULL SIZE VERTICAL ANTENNA
Full quarter wave which can be configured for 20, 15, or 10 – No coils or traps No tuner needed–VSWR less than 1.2:1 over each entire band–Folds to 5' package.

Model	Bands	Ht	Price
FV-201510	20 15 10	16'	$29.95

APARTMENT-PORTABLE-TRAILER AV-1 ALLTENNA
Use portable antenna anywhere– Mounts on window sill or patio railing–Solves landlord problems – 80-10 meters – Change bands by switching preset inductance– Adjustable to 1:1 VSWR at any frequency–13' maximum extended height–light weightunder 10 lbs. Use on travel campers and vans–Mounts easily on ground post(included) or on side of camper or van–No antenna tuner needed–Full legal power limit–Fully assembled & ready for operation–No radials required–Folds to 5' package for easy storage.

Model	Bands	Ht	Price
AV-1	80-10	13'	$49.95

Z-1 BALUN **$9.95**
1:1 ratio, takes place of center insulator helps eliminate TVI, coax fitting, full legal power.
A-1 Center Insulator $4.95
with antenna orders:
RG58AU & connector . . . . . 50' $5.95
. . . . . 100' $9.95
X8 Aluminum Radial Wire . . . . 100' $3.99
Nylon Guy Rope-450# test . . . . 100' $3.49

FULL SIZE DIPOLES

Model	Bands	Lgth.	Price
D-80	80/75	130'	$31.95

Please send all reader inquiries directly

situation wherein the newcomer just collects some books and struggles through the material without direction. A lot of amateurs have successfully prepared themselves to pass FCC examinations in this manner and many more will follow the same procedure in the future. This system does work but it is very time consuming and it can quickly kill the interest of would-be amateurs. If you know someone who is trying to prepare herself/himself to pass an FCC amateur radio license examination, please advise that person to consider one of the homestudy correspondence courses advertised by major electronic schools. Such courses are not very expensive and they do cover the essential material satisfactorily.

If you are one of those rare individuals who has the desire and time to help the newcomers to amateur radio, please understand that your help is very much needed by people in your area. Our amateur radio service needs the best people it can attract and some of the top amateurs are people who have benefitted from initial instruction on a one-to-one basis with some considerate and caring amateur. The advantages to such individualized instruction are obvious. The instructor is able to cover the material at whatever rate is suitable with the individual student; also, the student is automatically forced to participate in every discussion. If you provide this type of help, or if you intend to do so, it is advisable to set up a course outline and lesson plans to be sure all necessary material is covered in a logical sequence. If you are not sure what needs to be included, contact instructors in your nearest groups that conduct such courses; they should be willing to provide you with a set of their course material at little (or no) cost. If you can't get suitable material locally, you are welcome to request a free set from me; just enclose a large (10 by 12 inch) self-addressed envelope with two dollars to cover costs.

Most readers probably do not become involved helping newcomers obtain amateur radio licenses. If this is your situation, please realize that you will be helping if you simply tell these beginners where they can get the help they need. These people need a lot more than licensing help; they need to know about equipment, antennas, accessories, awards, operating techniques, and many other things. If you have the knowledge and time, your help will clear away many problems for newcomers. Whether or not you provide other personalized aid, you can do newcomers a good turn by directing them to known sources of good information, which are not plentiful.

CQ magazine has printed a lot of material to aid Novices since the Novice class license was established in March 1951. Novice Shack columns were written by Carl Drumm W2GJV (September 1951), Herb Brier W9EGQ (January 1952 thru July 1955), and Walt Burdine W8ZCV (August 1955). The name was changed from the Novice Shack to Novice and it was written by Walt Burdine W8ZCV (September 1955 thru February 1957), Don Stoner W6TNS (March 1957 thru January 1962), and again by Walt Burdine W8ZCV (February 1962 thru May 1966). The Novice column was not printed in the June 1966 thru the October 1973 issues of *CQ* but Herb Brier W9EGQ/W9AD wrote it with enthusiasm from November 1973 thru September 1977, when I picked up the mantle after Herb died. Herb, Walt, Don, Bill, and Carl wrote 90, 71, 59, 16, and 1 of these Novice columns, respectively. These 237 Novice columns contain a lot of interesting information for new amateurs of today, as well as the ones who will come along in the future. You will be performing a service to newcomers if you tell them about this excellent source of data on how things were, are, and will be for Novices. As is obvious from ads in this issue, Cowan Publishing has many publications that can help people prepare to pass FCC License examinations. A sim-

ple subscription to *CQ* will provide a new amateur with access to this Novice column, plus all the other good material printed in each issue.

Another excellent source of data for newcomers is the "New Ham News" published by ARRL. The ARRL publication, *QST*, is excellent and it is primarily intended for beginners. *QST* contains several ads of interest to both Novices and aspiring Novices. The league publishes the most extensive set of amateur radio publications that is available from any single source. A list of their publications can be obtained at no charge by requesting it from the ARRL.

Ham Radio magazine is definitely not the publication I would recommend to a newcomer to amateur radio, since it often contains highly technical articles. However, this fine organization also publishes *Ham Radio Horizons* which is a magazine written specifically for new amateurs. They also publish an excellent Novice Data Handbook.

73 magazine publishes several ads and articles of interest to new amateurs. They also provide code training tapes and a wide variety of helpful books.

The Novice column in Worldradio News is written by Armond Brattland-K6EA and it is another of the good sources of help to new amateurs. This excellent amateur radio newspaper provides unique coverage of amateur radio news in a manner that is interesting and informative to both amateurs and non-amateurs. Details are available by writing to 2128 28th Street, Sacramento, Calif. 95818.

Bring the preceding publications and columns to the attention of every newcomer you meet in person or on the air. There is no better way to bring these aids to the attention of new amateurs than for established amateurs to communicate this information to them. Please be an active communicator in this matter!

If you conduct Amateur Radio Novice Class Licensing courses, let your students know which sources of printed aids are available to supplement your instructions. It is useful to have samples of these items to enable students to evaulate them. It helps the newcomers if their instructor provides them with a printed list of these aids.

Tell aspiring amateurs that they can usually find out what their new callsigns are by checking the address labels on advertising they receive after passing FCC license examinations. Several amateur radio associated ventures purchase lists of new licensees and send ads. The address labels on these ads show callsigns and such ads can arrive before FCC licenses are received. Pass this well known fact along to newcomers because they have no other way to know there is a way they can learn their callsigns before their licenses are received from the FCC, and what amateur is not anxious to know his assigned call letters as soon as possible?! Communicate with anyone you know who is waiting for his/her first amateur license to arrive; let them know how they may determine their callsign a few days before the license arrives. If you serve as a volunteer examiner, let the applicant know about this matter.

The October 1977 *CQ* Novice column advises new and aspiring amateurs to make use of printed articles existing in major amateur radio publications to get a better understanding of subjects they need more help to understand. That column tells how to locate desired material by using the year-end index issues. Addresses of the major publications are included in that October column and non-Novice Licensees are urged to have that information on hand for the benefit of Novices and prospective Novices. It helps new people when established amateurs loan (or give) them issues of the major amateur radio publications for their perusal. I continue to receive comments related to this October Novice column and they can be summarized as requests for more information on sources of printed aids, other than *CQ*, *Ham Radio, QST*, and *73*.

Here is a list of the aids I believe are most useful to beginners in the field of amateur radio, with asterisks (*) used to highlight those items I believe are most effective. Material is grouped by subject matter.

PROUDLY PRESENTS

A Complete Line of High Quality Antenna Couplers

- These couplers will match most types of antennas and helps to lower VSWR of antenna systems down to 1 to 1.
- The LC circuit used is effective for reduction of TVI, BCI and FMI due to the inherent bandpass filter effect which attenuates the harmonic and spurious signals.
- These antenna couplers will help improve S/N ratio and cross-modulation distortion.

Order direct from this ad! Send check or use your Mastercharge or Visa.

The preceding listings are not complete. I have simply listed items I have on hand or have used recently. If you are aware of some item that is particularly helpful to beginners, please bring it to my attention for possible future use. The material in these listings is of interest to beginners. No attempt has been made to include items of interest to those attempting to upgrade to higher classes of amateur radio licenses. However, notes to the indicated companies will bring an excellent set of data on upgrading material.

It is hoped that this month's Novice column material will be passed along from those who know about it to others who need to use it. If experienced amateurs would bother to let newcomers know about the publications mentioned in this month's Novice column, they would have a much easier time attaining their Novice licenses. You can help our

amateur radio service by just letting prospective and new Novices know about these sources of information. When a newcomer asks an experienced amateur for information, it is easy enough to direct the Novice to existing sources of good data; please do not brush aside such requests since you could be brushing aside a would-be amateur. If specialized data is required, it is a simple matter to research end-of-the-year index issues to determine which magazine issues contain articles on the desired subject matter. It is now quite simple to make copies of a few pages to provide required information to someone who will be glad to have the help.

There are also about 24,000 government publications available and about 3,000 changes or additions occur each year. This mass of publications has been separated into about 270 categories (called subject bibliographies) to make it easier for potential users to locate desired material. Subject bibliography index SB-999 and price list 36 can both be obtained at no charge by requesting them from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402. Electricity and Electronics (SB-53), Radar and Radio (SB-172), and FCC Publications (SB-281) are three subject bibliographies which are likely to list publications of interest to all amateurs and prospective amateurs. All subject bibliographies are available in any desired quantities and at no charge from the address shown above. Most subject bibliographies are updated annually and updated issues will be supplied if one states that they are desired.

This column is intended to help Novices and prospective amateurs. This month's column was written in response to several requests for help in locating needed publications. It is hoped that you will put it to good use to help those who do not know anything about becoming amateurs.

Here are a few stations W6DDB recently worked on the Novice bands. WB1CGG David @ Dover Foxcroft, Maine, WA2OHD Tom @ West Islip, New York, WB3GTT Steve @ Jonestown, Penn., WD4FGX Terry @ Red Ash, Va., WD5EJC Tim @ Dallas, Texas, WB6TCO Allen @ Fair Oaks, Calif., WB7ECH Joyce @ Everett, Wash., WD8AOA Gary @ St. Joseph, Mich., WD9GRS Akinori @ Carol Stream, Ill., WDØDYH Martin @ Denver, Colorado

Novices are urged to submit good black and white pictures of themselves at their operating positions. If your photo is printed in a future Novice column, you will receive a year's subscription (or renewal) to *CQ*. A brief description of operating activities is needed with pictures submitted in this photo contest.

73, Bill, W6DDB

RTTY for ALL Systems

ELECTROCOM® "SERIES 400" FREQUENCY SHIFT CONVERTERS

Professionally engineered for outstanding performance, stability, and reliability, the Electrocom® Models 400 and 402 add new dimensions of compatibility between radio and teletypewriter systems. Manufactured to highest quality standards—an Electrocom tradition for nearly two decades—these units are ideal for military, government, commercial, civil defense and amateur applications. The Model 400 front panel digital knob accurately selects shifts up to 1000 Hz., while two such knobs on the Model 402 independently set the mark and space frequencies. Both models may also be preset with any tone pair between 1000 and 3200 Hz.

Optimum performance with FSK or AFSK systems is assured by matched filters, precision linear detectors, baud rate selector, bias compensation, and semi-diversity circuitry. Operation is enhanced by a CRT monitor, autostart with solid-state motor switching, antispace, markhold, EIA/MIL output voltages, and a constant current loop supply. In addition, various options are available including rack mounting and polar current output.

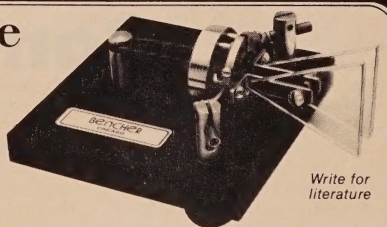

Write or call us for complete product details and specifications. Learn why Electrocom® "400" Converters are designed not only for today's communication environment, but ultimately to fulfill RTTY requirements for years to come.

10,290 QSOs in 48 hours (that's 214 per hour!) added up to a total of 21,351,898 points in CQ's 1977 World Wide DX Contest. The new holders of the all-time record tell our readers how it was done.

The EA8CR Multi-Multi Contest Story

BY VILLE HILESMAA, OH2MM AND FERNANDO JUAN FERNANDEZ MARTIN, EA8CR

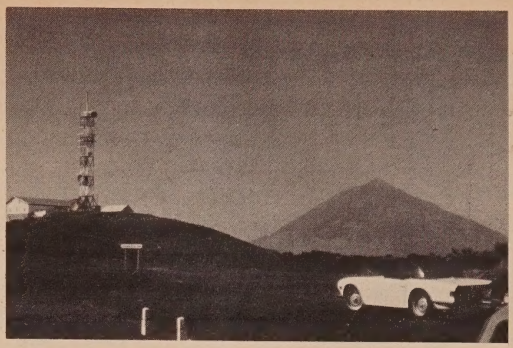

Nobody knows for sure where the best QTH for the *CQ* World Wide DX contest would be. However, it would seem that the ideal QTH should be in the southern hemisphere so that the propagation on the upper bands would last as long as possible in the autumn. It is well-known that the more to the North a QTH is located, the earlier the 10, 15 and 20 meter bands close in late October and November when the *CQ* World Wide DX Contest—the biggest and best of all contests—takes place. If a QTH is too far in the southern hemisphere, problems arise on the lower bands, that is, 40, 80 and 160 meters. If too far to the south, the distance to the densely populated amateur areas would be too far, so that the number of QSOs and multipliers would be low. Since the densely populated amateur areas are North America, Europe and Japan, easy access to at least two of these three areas is essential for achieving a good contest score. Also, the ideal QTH would not be located on these three continents (NA, EU, AS), because there would be too many one or two point QSOs. So, the "good" continents are South America, Africa and Oceania. This is where the great majority of the contacts available will count for three points.

Shown here is the island of Tenerife. Our contest QTH (marked X) was way up in the mountains far away from the not-so-understanding neighbors!

An important part of the contest preparation—eating well beforehand and having fun with great friends. Nothing can replace good friendship. From left: EA8CR, EA8IT, OH2MM, EA8BW, EA8LO, EA8OZ.

Here is the view to the west from Izana. The TV station and the peak of "El Teide" mountain are clearly visible through the thin, ever-clear air.

What then is the very best location for making a multi-multi world record? We felt that the two best places in the world would be the northern part of South America and West Africa. We ruled out Oceania since it is probably too far away from "everything." Although very impressive single-op results have been made from Oceania, contending multi-multi efforts have been lacking so far. Of course, all of the above is particularly applicable to the years of low sunspot activity. During the peak years, good all around propagation is found at the northern latitudes as well, so that the geographic location is less important.

And so, we came to the conclusion that the Canary Islands are one of the best QTH's. They are located on the northern 28th latitude (the same as Florida and the southern corner of Texas). Europe is very close and boils in well on all bands. On the other hand, North America and the Caribbean are not far away either. The Caribbean is especially important since it is a potential source of a large number of multipliers. There are an ever increasing number of DXpeditions to the many beautiful islands there. Although Japan and Oceania are sometimes difficult places to get into from EA8, you never get everything. Knowledge of the propagation helps and most of the Pacific multipliers can be picked up.

Forming the EA8CR Team

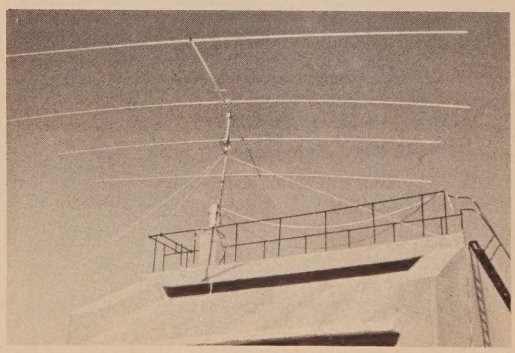

Up till now, almost all big contest efforts were realized on a single nationality basis. This is natural since planning such things usually requires long haul preparations. A concise, closely knit group can manage best. A multi-national effort implies several risks. There is the language barrier, differences in thinking, and a lack of understanding of the many peculiarities of the different cultures.

The formation of our group took a long time. Years passed and several contest men worked each other repeatedly. They got to know each other better and better. Finally these differences disappeared. We all became part of the same nation—the contest nation—and all barriers faded out.

The contest spirit has always been high in Finland. Serious efforts have been made every year within the last 20 years, such as OH2AM and OH5SM in the 60's, and OH1AA and OH2AW during the 70's. When the propagation was poor to Finland, the Finns went down to where the propagation was, and so, ZD3X, ZD3Z, and OD5IQ were put on the air. Every year, EA8CR was worked by the Finnish teams and gradually we became good friends over the air. Beginning in 1975, our contacts were no longer confined to contest QSOs. That was the year when concrete cooperation between us got started, the year when Ville, OH2MM, visited EA8CR. A couple of operations resulted in the 1975 *CQ* WW DX contests. A "big" operation has been in our minds ever since. Things culminated into definite plans when EA8CR visited Finland in the summer 1977. Our first action was to establish a goal. We knew that the Potomac Valley Radio Club operators held the world record for the CQ WW contest since 1974, when they used the call PJ9JR. We felt that the time for challenging their 19.5 million points had come. We shook hands in an idyllic restaurant in Helsinki and sealed the mutual agreement with a burning draught of the strongest Finnish vodka available.

That's our operating site—the observatory of Izana, located on a plateau well above the clouds.

Something wrong here? Nuts, the reflector and driven element have been interchanged on the 204BA.

Asleep at the switch? No, indeed. Here's how Miguel, EA8IT, looked as he strained his ears for a few last contacts on 40 meters during the last of the 48 hours . . .

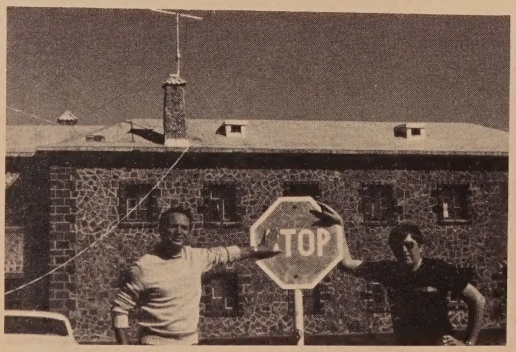

Right in the thick of the action, Jorma, OH2KI/OH3XZ, puts the CQ machine on the 160m station, as Ville, OH2MM operates 15 meters in the background.

Searching for a Suitable Location on the Island

After a careful search, much thought and discussion, and an evaluation of the pros and cons of the many potential QTHs on Tenerife, a basically ideal location was found by the Canarian Island part of our team: The heights of Izana near the summit of "El Teide", an ancient volcano that rises up to 3718 meters (11000 feet) above sea level. The installation of Radio Television Española of the Canaries in Izana is located there. The important Observatorio Meteorologico del Servicio Meterologico Nacional is also located at the summit. Izana is situated at about 2400 meters (7200 ft) above sea level. From there, one has a clear shot to the USA, to Europe and to most other parts of the world, with a sheer slope down to the sea in all directions except west. The only place around higher than Izana is the peak of El Teide. Fortunately, it is ten miles away, so that shadowing of the horizon occurs only to the west where the South Americans would be heard. And—can you imagine—the chief of the observatory was an amateur, EA8IY, who agreed to have his quiet place converted into a major multi-multi contest QTH, with more than ten antennas hung all over everything and more than ten amateurs literally taking over his territory. The choice of Izana was not an easy one though, due to several factors. First, the altitude meant hard climatic conditions, especially cold weather in the nights and possibly high winds. There might be problems in installing the antennas. Likewise, it might even be difficult to get up there because the serpentine road leading to the summit might be icy and dangerous, preventing all traffic up and down. All this was carefully evaluated using a multitude of data available directly at the observatory. Finally, the meteorologists considered the risk of bad weather in late October small enough to clear our operation.

There were other important things to be checked, too. Due to the height and the low atmospheric humidity, an elevated amount of QRN was suspected. A few nights spent up there working 80 meters dispelled that problem.

Then there was the possibility of interference. The Radio-TV transmitting station was only half a mile away! All bands were carefully checked in order to square out possible h.f. interference from the TV station. Also, numerous temperature, humidity, wind and solar registration equipment are in operation 24 hours a day at the observatory itself. Test transmissions on amateur bands were carried out. A slight amount of interference was found on a couple of the less important monitoring units. Fortunately, the staff thought that they could manage despite the interference during the contest weekend. Further, one commercial and one military communications link are located in the area as well, but they did not pick up any interference from our amateur band transmissions. All was looking great at this point, yet we still had a couple of things to check. We heavily loaded the a.c. line of the observatory building in order to see whether it was capable of supporting

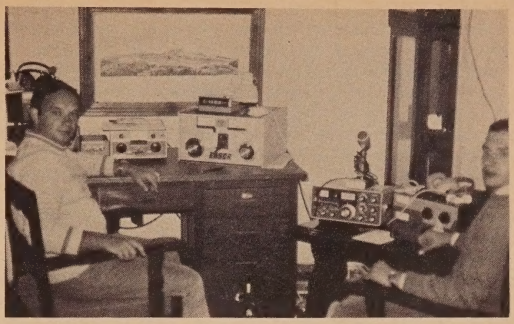

By Saturday evening, we had already made 7000 QSO's. Fernando and Martti started getting an idea of the final result, as this modified sign indicates.

Here's 10 meters with Miika, OH2BAD, in action. Ten meter propagation was a pleasant surprise, and almost 3000 QSO's were made.

Martti, OH2BH, the CQ WW single op phone record holder, was responsible for the fine 20 meter effort of EA8CR.

On 80 meters, Fernando, EA8CR (left) and Luis, EA8BW, relax during the quiet hours. We couldn't get them to leave their chairs.

our power requirement. The a.c. cable was first fired up through the wall outlets. We found that the use of the old internal cables in the house would be dangerous. Since there was a breaker box at one end of the building, we decided to run a cable of our own to each station.

As you can see, a lot of work was put into the checkout of our future QTH. So, we would like to repeat a few things of vital importance that should be considered in every effort like ours:

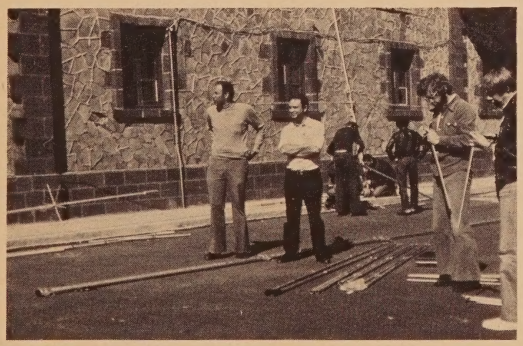

1. Be sure that the owner and staff of the future QTH completely understand how big and how many antennas you are going to put up.
2. Acquire enough weather information and estimate the risk of bad weather (rain, thunder, winds, frost).
3. Remember that RFI, TVI, or similar interference exists almost invariably. Make extensive tests and eliminate upcoming problems with a technical solution, such as a filter, or by agreeing on time sharing with the user of the interfered equipment. Every DXpedition should include a participant capable of instant RFI/TVI diagnosis and correction.
4 Make sure that the a.c. supply is sufficient, stable enough, and available at all times.

If you do not appreciate the need for such preparation, no amount of operating skill in the pile-up can guarantee you a first place in the contest. Remember when the second 48 hours comes up, the game is over. The winner is the guy who has worked out everything BEFORE the 48 contest hours are up.

Putting up the Station

Fortunately, the local EA8s felt sympathy to our effort and were willing to help. Ten complete RX-TX-linear sets were obtained, representing a variety of manufacturers: Drake, Yaesu, Collins, Heathkit, Dentron, ETO, Triton, Sommerkamp and so on. Three beams were acquired, namely a HY-Gain TH3MK3, a 204BA, and a 103BA. A 14AVQ and a Hustler 4BTV plus a lot of wire, dipoles, coax, etc. were also on hand. One of the most important and expensive investments was the a.c. cable which was to provide electricity to all stations in Izana. Several spare rigs were available, in addition, to fill in the event of failure.

The Finnish part of the team landed on Tenerife five days before the contest weekend. Fortunately, economical charter flights were available directly from Helsinki to the Canaries, otherwise the trip would have been rather expensive and would have included several plane changes. All the expenses were paid by the participants themselves. The Finns had a rather unusual combination of radio gear with them: A ten meter beam, a few headsets and crystals, and some filters and traps. Everything else was available locally. The Spanish and Finnish groups met in la Laguna. The final operator crew

Shown are Miguel, EA8IT and Fernando, EA8CR looking for a place for an 80m dipole. Miika, OH2BAD and Kari, OH2BKH are busy assembling hardware. In the background, Reijo, OH2EW and Jorma, OH3XZ all putting finishing touches on the TH3MK3 shown up against the wall, as Tomas, EA8-256OU, a young upward coming "star" in EA8 land, watches.

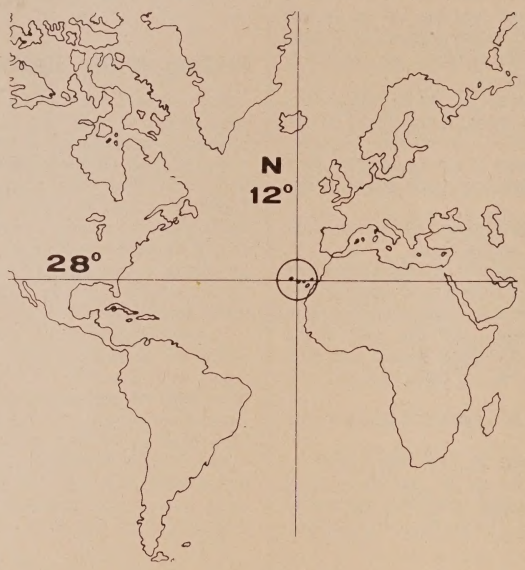

This is the QSL that will be sent sooner or later to all stations worked. If you don't get yours, just get in touch with OH2BAD.

The Gang and the Gear. Front row, from the left: Jorma, OH3XZ; Miguel, EA8IT; Fernando, EA8CR; Martti, OH2BH; Ville, OH2MM; Miika, OH2BAD; Back row, from the left: Luis, EA8BW; Julio, EA8OZ; Tomas, EA8-256OU; Jose Manuel, EA8LO.

consisted of ten men: EA8's BW CR IT LO OZ and EA8-256OU; OH3's BAD BH MM and OH3KI/OH3XZ. In addition, OH2s BE BKH EW and a few XYL's followed as general assistants.

Six cars and two trucks were loaded up with gear and a jolly crew of people. The spirit was high when the car caravan got on its way up to the mountains. Driving up there was an experience itself. First the hot sun down at the sea level, then a sudden dive into the thick clouds on the way up. At times a heavy rain almost stopped us. Finally, the cold, clear thin air of Izana appeared with the eternal sunshine above the clouds. We were heartily welcomed by EA8IY, Fernando Molina, the chief of the observatory and the rest of the staff.

The staff included Ramon, his charming wife and their little son and four big dogs. The cargo was rapidly unloaded so that the intensive installation work of the next four days could get started. Several teams were formed: A beam assembly team, a roof climbing team, an a.c. power cable team, an equipment installation team, a dipole-groundplane team and so on. Each day we were able to work from 8 a.m. to about 8 p.m. At night, the temperature fell down to zero C (32F), and the darkness inhibited all work outside. Because no heating and food were available in Izana, we drove every evening to Parador Nacional, a mountain hotel about 25 km (15 miles) from Izana. There we took showers and healed our sunburned faces. The traditional Spanish supper with at least four courses was waiting for us. We all sat around a big table, enjoyed the delicious food and drink, and made plans for the next day. The strategy for the contest operation itself was outlined, including the optimal distribution of operators and available equipment for each band. Short and long path propogation and the gray line openings were analyzed using own experience, propagation forecasts and logs from previous years.

Tenerife is located between America and Europe as shown. It is very advantageous for the CQ WW DX Contest, easily heard by both European and U.S.A. amateurs.

Problems, Problems . . .

Up they went, beam after beam, and wire after wire. By Friday evening everything was ready—or was it? First, the twenty meter beam was found to have a zero front to back ratio and its resonance point was below the c.w. band! Why? Thus, we found that the rotator was not able to turn the antenna. How was that possible? After careful observation of the antenna we discovered that it had been incorrectly assembled so that the driven element and the reflector had accidentally been interchanged. So, the beam was taken down in darkness just a few hours before the start of the contest and the mistake was corrected. The trouble in the rotator lay in the control box. Would you believe it was a brand new HAM-2—never used before. That taught us never to take anything along to a DXpedition in an unopened factory package! An urgent telephone call was made immediately down to Santa Cruz to Juan Luis, EA8JP. He graciously disconnected his own HAM-2 control box, jumped into his car, and drove up the tedious road to Izana in darkness. So, the rotator problem was solved and the twenty meter station was rescued.

Another antenna problem: The ten meter 3 element monobander, the 103BA, had been used only once before in a Gambian operation back in 1972. The settings had been carefully marked and the antenna lay unused in the garage of OH2BCP for five years. Now it was assembled again. That was easy enough due to the clear markings left on it. But wait, there was no mark showing on which end of the boom the reflector should be mounted! Drat it, the manual was missing too! There were two possibilities. Which one was right? First, we tried to get the information on the band. Several antenna experts gathered on the frequency but none had a 103BA. Despite the advice, no agreement was reached on 20M s.s.b. So, we had to toss a coin to decide which way to try it first. A good s.w.r. and front-to-back confirmed the correct assembly on the first try!

A great deal of attention was paid in choosing a location for each antenna. Antennas for different bands were located as far as possible from each other. Multiband antennas are generally not suitable for multi-multi, because they pick up a lot of r.f. on several bands—that is what they are built for. We

used a TH3MK3 for 15 meters because no monobander was available.

Whenever a multi-multi installation is made like this—*ex tempore*—there will always be some interference from one band to another. Certain receivers are easily blocked by signals from transmitters on other bands. Fortunately, we had a lot of different types of receivers available and we played musical chairs with them until the QRM was reduced to a minimum. Sometimes, the QRM from the other bands could be solved by inserting a simple trap, such as a coil and condenser, in series with the antenna input of the receiver. For example, 21 MHz transmissions blocked the 28 MHz receiver. A trap for 21 MHz was installed in the receiver front end and all QRM disappeared. The second harmonic from 7 Mc (7080 Kc) also blocked quite a large portion of the twenty meter band. The problem was minimized by locating the antennas far enough away from each other, and by choosing a linear with the maximum second harmonic attenuation for use on 7 Mc.

The Time Had Now Arrived for the Contest Itself!

It was midnight local time (same as GMT) when the contest started—and everything WAS ready. The pileup on the lower bands built up immediately. Ten and 15 meters were almost closed but hard shouting yielded a few QSOs thru the night. Early in the morning, 10 and 15 suddenly opened up and the Europeans attacked us as eagerly as hawks. A roaring, thick pile-up was generated on our frequencies. In the early afternoon the Europeans started fading out and the first Americans started to come through. On 10 and 15, a continuous pile-up lasted from 7 a.m. to 7 p.m. Twenty meters was open practically all the time, but good propagation on the upper bands had clearly reduced the activity there. One-hundred sixty, 80 and 40 were practically empty during most the daylight hours, but required continuous watch to pick up all possible African locals during the day.

Odd, but activity on Saturday and Sunday was different. Saturday was the day when the "real" contest operators showed up and spat their numbers out in rapid fire at each other with their big beams. Sunday was more peaceful. We got in touch with the "deep" layers of the pile-ups—that is, stations who asked what country EA was and "would you please repeat my report, was it 59 or 33?"

We had a main station and a second station side by side for each band except 160, which was worked by the second 15 meter station. Each second station had a separate antenna, a dipole. Two operators were devoted to each band except 10 and 160 which were run by two operators jointly. Everybody worked only his assigned band. We felt that it was best that way. Jumping from one band to another tends to generate confusion. The function of the second station was, of course, to pick up multipliers. However, that was sometimes a very annoying and difficult task for the second operator. The main station signal on the same band usually blocked his receiver. Just when he would get part of a rare call copied, a strong burst from the main station would wipe him out. Of course, that was to be expected because the listening dipoles were so close to the main station beams. Listening on the same band without interference while the main station was on would have required special filtering technology. Such front end crystal filters were not available to us. Hence, only a handful of multipliers could be picked up by the second stations. They did serve as instant reserve stations and, indeed, on 40 a TR4 and on 15 a SB220 ceased working and these were immediately replaced by the second stations. In any multi-multi effort, equipment trouble will always come up. You don't always know when and where, so be prepared. Remember you cannot afford to lose one minute out of those 48 hours.

Everything went smoothly for us until early Saturday evening. All of a sudden, the power disappeared on the 10, 15, 40 and 80 meter stations. The only band that was operational was 20. The observatory staff was notified immediately. No obvious trouble, such as fuses or loose cables were found. Deep distress enveloped us. Was this really the sad end to all our effort? Finally, we called the crew at the TV station next to us. EA8FA happened to on duty and rushed immediately to our QTH, understanding the urgency of our situation. He isolated our power problem to a transformer building a few hundred yards from our QTH. From there, all of the electricity was distributed to the Izana area. Due to the exceptional loading, overheating had occurred in one of the transformers and protection circuits had cut off the current. Our source of power was changed over to a transformer with a higher rating and finally, after 90 minutes, the heavy juice filled up all the gear again. Without that break we would have made at least . . . well, no speculations. That was our fault—we hadn't checked things well enough beforehand . . .

Just Who is a Good Contest Operator, Anyhow?

Lots of contest operators like to compare their "best hour," that is, how many QSOs were they were able to make in the pile-up. Of course, pile-up rates are very important. But, equally important is how many QSOs the operator gets when there is no pile-up. Those non-pile-up periods at EA8CR consisted of approximately half of the 48 hours on each band. During these quiet hours, multipliers have to be squeezed out of the band and countless frustrating unanswered CQs have to be called on an apparently dead band. A CQ tape machine is of great help and should be part of every modern multi-multi installation—yes, even in a rare location. A multi-multi station should be kind of a beacon, so that every casual visitor on the band finds him. Also, the main operator's chair should never be left unoccupied! That was the rule at EA8CR and it paid off. A good operator will tirelessly call CQ on the quiet band. He will break into every French speaking QSO party and pick up all those TR8's and FK8's. He is not depressed when making only 10-30 QSOs per hour. That may well be the ten QSOs more than the competitor is getting in a similar situation. There are a lot of guys who think that they are the best pile-up-ops in the world. Yet finding a good non-pile-up-op can be much more difficult.

The Future

The word is out that the Potomac Valley Radio Club is preparing revenge from Curacao. We wish them the best of luck. In fact, if anyone breaks our record, we know that they certainly will deserve it. It will take lots of hard work, planning, a better QTH, more sophisticated equipment, better operators, or all of the above to break our 21.3 million points.

The Credits

We want to express our deepest gratitude to the magnificent Fernando Molina, EA8IY and his staff—Ramon and his XYL—for letting us stay in their observatory; to Jesus, EA8FY, for substantial help in acquiring the power cable; to Gilberto, EA8FQ, for solving our a.c. power problem; and to Juan Luis, EA8JP, for lending us his new 204BA and bringing up the rotator control box. Our thanks also to the local delegation of URE for lending us equipment; and to Larry, N6AR for revising the English language version of this story. And last but not least—thanks to everyone who worked with us in the contest—without all of YOU working with us in the contest, we would have accomplished nothing.

Oh, by the way, the QSL manager for the contest period only is OH2BAD. He has already answered all cards sent direct. All other QSO's will be confirmed later with a special contest QSL via the bureau regardless of whether a card was received or not.

Results of the 1978 CQ World Wide WPX SSB Contest

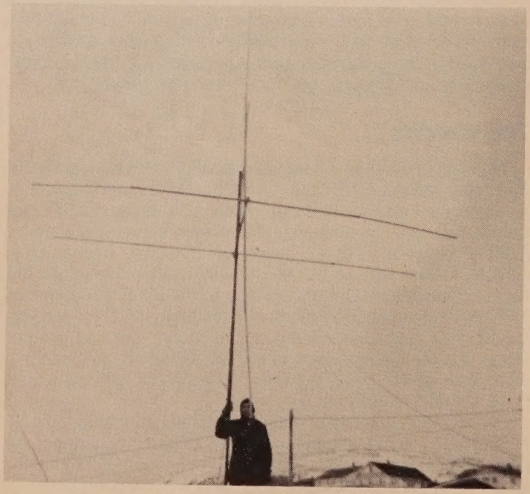

BY BERNIE WELCH,* W8IMZ

Highlights

UK9AAN	**—Highest All-Time Score**
VC7WJ	**—Second World High Score**
4T8V	**—First QRPp World Champion**
CW3BR	**—A 3-Million Plus 28 MHz. Score**
KP4RF	**—New World Multi-Single Record**

The DX gods blessed us with outstanding propagation, a multitude of new prefixes, great participation and no Murphy! A super contest and we look forward to next year." This quote from the Canal Zone by Fred Regenitter, KZ5FR, sums up a large number of appreciate log comments. I agree and one thing's for sure, the 10 and 15 meter bands were terrific and should be even better in the 1979 contest.

*7735 Redbank Lane, Dayton, OH 45424

Bob, FPØLK with the 10 and 15 meter quad he used with FPØBG.

This 22nd Annual Contest has replaced 1977's all time record year with the largest participation ever and with a twenty-three percent increase in the number of logs received.

Our available data indicates that it was possible for a station to have contacted over 600 different prefixes this year. The previous all time record of 517 held by DK2BI ('76 contest) was surpassed by UK9AAN with 532. K4VX was runner up with 519, followed by OG1AA—497; KP4RF—485; CG3AKG—470; UA9ACN—459; UK6APA—456; UK6LAZ—453; EI1AA—451.

All of this could have been even greater. Unfortunately, however, some areas of the world found band conditions diminishing on Sunday afternoon. Another deterrent factor was that this contest occurred on a religious holiday weekend. Some participants indicated that we should have changed the dates this year, however, in a large world wide DX contest such as this, stability of dates is most necessary. It won't fall on Easter again for seven years.

This was the year we initiated two additional classifications of competition,—the Club Competition and the QRPp Section. The Western Washington DX Club is our very first Club Trophy Award winner. The competition was challenging. Other top battlers were the Toronto DX Club, The Potomac Valley Radio

The top African multi-single score was by Kari, OH2BC and DX Hall of Fame member Marty, OH2BH at CT3—Madeira Island. They set a new African record.

Club, and the DX Club of Puerto Rico. Our new QRPp Section proves that 10 watts input or less can successfully be a part of a large DX contest. Paul, 4T8V won our first QRPp World Wide Trophy. Ron, W8ILC is top USA scorer and will receive a special CQ award. Coming up close behind was Gene, N2AA. SK2KW, operated by Rainer, SM2DMU, acquired the top European score. Record high scores were attained in the multi-multi category. The highest score ever in a WPX SSB contest is 10,702,776 by the Asiatic Russian Club Station UK9AAN. The VC7WJ group established a new North American record with the second highest score ever of 9,389,696. OG1AA with 6,629,483 points is the new European record holder. The KP4RF multi-single score of 6,113,910 is the new world record for this category. The top world single ops are J.R., UA9ACN (All Band) and Yuri, CG3BMV (21 MHz.). Norman, YBØACT (28 MHz.) and V.W., ZL2ACP (21 MHz.) set new Oceanic records. European records have new owners also: Heinz, DK5WL (28 MHz.); Drago, YU3ZV (21 MHz.); John, ON4UN (14 MHz.); Seppo, OI1VR (All Band).

NFDXA past president Bill, WB4EYX packed his gear and went to the Turks and Caicos Islands in quest of a new 10 meter record as VP5WW. Rafael, CW3BR decided to try for a new record also on the same band. Results—CW3BR has the new world record and VP5WW has the new North American record.

As an indication of the over all high scores that prevailed, 137 stations scored over 1,000,000 points each. That's almost three times as many as last year. In fact, to keep track of all the new achievements you should check the current All-Time Records to be published in the Feb. 1979 issue of CQ.

Activity by a considerable assortment of prefix goodies, such as the large number provided by Canada and Finland, along with the following, contributed to the exceptional results of this year's WPX: XK6, DA4, LJ2, KZØ, 6F8, WP4, VC7, CT7, S8, GB3, DX4, J3, WN8, HD1, 4M5, 4A1, ON7, VB3, XF1, SK1 thru Ø, EA8Ø, LG5, RŁ7, CK1, IV3, OF1, PA1, 2, & 3, 4U1, CT9, PP5, HG5, 7 & 8, CG1 thru 7, 4T8, OG1 & 2, IN3, LF2, DUØ, RB5, PT7, GU3, LX, OI1 thru 3, HV1 & 3, RA4 & 9, ISØ, IT9, DT1 thru 7, WN4, AA4 and AA6.

The new USA "AA" and "N" prefixes saw a great deal of action. Other new prefixes like AB, KB, AL, NH, NP, WH, WL, WP, KH1 thru 9 and KP1 thru 5 should be available for the '79 contest—all thru the courtesy of the FCC.

Some stations failed to take the extra multiplier for contacts with PAØERW/LX which counts as LXØ for WPX. Prefix credit for VE7CQX/SU would be SUØ. All portable suffixes that contain no numerals should be assigned an arbitrary Ø, for WPX Contest and Award purposes. How about those great around the clock pile-ups by rare and semi-rare DX stations such as: JT1, CR9, 9K2, 9L1, FY7, BV2, S8, KM6, FS7, TF3, CEØ, VP5, ZK1, SUØ, KG6, EP2, FPØ, YBØ, CT3, CN8, D4, HL9, HS1, P29, 4X4, ST2, TR8, TU2, VP8, VR4, YJ8, YKØ 5Z4, 7P8, 9V1, 9G1, JY5, EA9, and VU2. They provided many with a new DX country and it's appreciated.

The number of contest expeditions doubled. To these contesters who go above and beyond the call of duty to make the WPX even better, we, unfortunately have but one trophy to award. This is the toughest decision of the contest. This year's winner is GD5CGV, operated by a group from West Germany—DF7FH, DJ3BG and DJØUP. Mort, W1UQ and Claire, K1YL took time from their vacation at St. Maarten to contest as PJ8UQ and PJ8YL. To make it even more interesting Mort journeyed to the French side of the island, about one mile, and gave many an extra multiplier as FGØDDB/FS7. Doc, W2BBK as PJ8AA, managed to squeeze the contest into his family vacation. We were happy to be a part of their vacations. From Bolivia, Phil, CP1AT reports that this was his last one from the QTH for some years, as he is returning to the USA. He has been a veteran of this contest for many years and provided prefix chasers with the special CPØ in our '77 contest. We hope Phil will find time to enter the '79 event with his USA call.

Established in 1959, Morokulien is a fictitious country that exists exactly on the border between Norway and Sweden. It is of special interest to amateurs as it is the home of two very unique prefix stations, LG5LG and SJ9WL. The name Morokulien is a combination of Norwegian and Swedish words for "fun". And fun is what Ulf SMØGNU and Lars, SMØGMG experienced in our '77 contest as SJ9WL and again this year as LG5LG.

These Outback DX Club members did a fine job and came up with the fourth highest European multi-Single score this year. They said they hope to have a special call again in the next WPX Contest. QSLs for LG5LG go to LA2ZN. Send along at least 3 IRCs which are used as a contribution for handicapped radio amateurs. This year's largest computerized log was the 4U1ITU operation by: Holger, DL7SP; Martin, DC7GL; and Wolf, DL7RT with assistance by Wolf's XYL, Heidi. They felt their effort was well worth the trip from West Berlin to Geneva even though they had to put up some low band antennas in heavy snowstorms and repair a baked tune condenser with Heidi's nail file. They said European 160 meter contacts were

The all band, 2 million plus score by Al, G3FXB was the largest from Engalnd.

Here is Terry, N6CW, holder of a new USA 21 MHz. record and 2nd World High score.

Two super contesters display their '77 WPX Contest trophies presented at the Contest Forum '78 Hamvention. Pedro, KP4RF and his multi-single group and Yuri, CG3BMC, each set new records in '78. Watch for them in Dayton in '79.

not as plentiful this year. QSLs for this operation only go to DL7RT. By the way, Wolf is also 3AØHK. Will it be Monaco in the next WPX Contest?

In the wondering and wishing department, we wonder who will be the first to establish a single op. all time record score for Africa, Asia, Oceania and South America on 1.8 MHz. It's hard to believe that there is still no 3.5 MHz. record for Africa. Also, it would seem that now is the time for some eager USA group to up-date the multi-multi category, as this year many multi-single and single op. record scores were higher than the current multi-xmitter scores.

Rumors tell us that a special, never before used, Asiatic prefix "EX9" may be initiated in the next one.

As a result of the thousands of requests received over the past five years for a WPX C.W. Contest—it's gonna happen!! The first will be held on the 26th and 27th of May 1979 (GMT), and on the last full weekend in May, thereafter. Current SSB forms and summary sheets can be used by indicating "CW" thereon, or you can make your own, using our basic format. Rules will be generally the same as for the SSB contest and should be published in the Jan. '79 *CQ*. The WPX SSB Contest will continue to be held on the last full weekend in March. We need additional trophy and plaque donors for the new WPX CW. Any club, group or individual desiring to donate please contact W1WY as soon as possible.

European contesters have indicated they would like a trophy for their continent (Single op, Single Band/ All Band). So how about it? Do we have any European donors?

I am happy to report that I have been appointed Contest Forum Moderator for the 1979 Dayton Hamvention, scheduled to be held April 27, 28, & 29, 1979. We appreciate the tremendous turnout of over 500 at the Forum last year. The many complimentary comments pertaining to the program are greatly appreciated also. The program was one of the best that I have had the privilege of presenting, and the program of '79 should be just as enjoyable. Plans include Frank Anzalone, W1WY, *CQ* Contest Chairman and Alan Dorhoffer, K2EEK, *CQ*

The DA4CC group provided a truly unique prefix on the h.f. bands. (Left to right) Bill, DA4CC, Bob, DA1GR, Walt, DA1BD and Pat, DA2AA. Walt's XYL, Mickey was the Go Fer. Op. DA1QS is not shown.

WPX Contest Veterans: (Left to Right & Frank, W1WY, CQ Contest Chairman; Steve, WBØRET, now KØCS, Kansas City DX Club Contest Manager; and Floridian Myron, WB4VQO got together at the '78 Hamvention. This year Steve holds the highest score for the USA Ø district.

Editor for the presentation of trophy awards; members of the *CQ* Contest Committee; ARRL Contest Advisory Group; and other well known contest personalities, plus a surprise or two. Those of you outside the continental USA who are planning to attend the Hamvention, please contact W8IMZ as soon as possible as we would like to introduce you and perhaps, include you in our forum program. If you like contests, you'll love this forum.

Over 200 photos were received this year with logs, but regretfully, we are only able to use a small portion in this article. We will use a number of them in our "Contest Corner" in conjunction with the publishing of the '79 WPX rules. Also, in the near future I plan to have a special contest article in *CQ* and will make good use of some of the photos. Please keep sending them along with your logs. We do our best to publish as many as possible, when the opportunity arises.

Official log forms and summary sheets are always available from the *CQ* office by sending SASE and IRCs. Please send your requests early.

As per our usual policy, the Certificate Awards will be in the mail at the earliest possible date.

We cannot begin to acknowledge each individual, group, club and agency responsible for making this an outstanding event. We assure you the efforts are greatly appreciated and hope that you will continue to support us in both the WPX S.S.B. and C.W. contests in 1979. Please send in your log, regardless

of the number of contacts or score. This is so very important for our computation of the final results.

I especially want to acknowledge our *CQ* Contest Chairman, Frank Anzalone, W1WY, whose tireless and enduring efforts for more than twenty-five years are greatly responsible for *all* of the *CQ* Contests reaching the heights of popularity that they now enjoy.

The tremendous work load this year in cross-checking, computing, and preparing these results would not have been finalized in time to meet our December issue deadline without the dedicated help of my XYL, Eleanor, who clerically assists us. A Final—Final!—The promised photos of the ops. at UK9AAN had not arrived at press time!

Hope to work ya in the next one. . . .

73, Bernie, W8IMZ

Random Contest Comments

"Love to have 9N1, EP2, VQ9, A4X, C5, OY8, S79, SV1, YBØ, 9K2 answer my CQ's! . . . WA1SQB. Funniest story—Having son admire our garage door automatically going up and down at the same rate as my transmissions . . . W1HZH. Finished up 10 meters for 5 Band DXCC . . . WB2AIO. W8LRL very tough competitor (160 meters) . . . K2BQ. Looking forward to CW WPX next year . . . W3LPL, op K3NA. Really enjoyed contest.

European Multi-Multi Record Champion Operators of OG1AA (Left to Right) Hannu, OH1LG; Lauri, OH1HU; Pekka, OH1TV; Arto, OH1NH; Reijo, OH1MD and Pertti, OH1LW. (In Front) Timo, OH3ZE. The operator Reijo, OH1NM is not pictured.

Much more fun than the ARRL DX test . . . WB3DKT. 1st WPX Contest—I feel I have better chance having new WD4 call sign. Good for us newcomers . . . WD4LCO. My old age and temperament are not what they used to be . . . W4SQ. Real fun contest. Got about 60 new prefixes for WPX Awards. This is one of the best contests going . . . N4MM. ST2HF hiding his 50 watts and dipole at 28772 . . . N4KG. Would like to see a *CQ* stateside only contest—maybe an SS type? . . . AA4NC. Amazed to work all those JA's on 40-M . . . WA5IYX. My first real DX on 40 meters . . . WD5EWP. Single op should have 38 hours for operating . . . W6HX. Worked ZL2HE and LU1HE back-to-back . . . N6HE. Got call from "F" station—reminded me he was my first 6W8AE QSO, 14 yrs. ago . . . K6YRA. KM6FC was a new 160 meter 2XSSB country . . . K6SE. Who pulled the plug Sunday? . . . N7DX. JA6XMM was 5X5 with one watt . . . W7FP. Ice storm Saturday put best SWR at 3:1. Slowed QSO rate a bit. Looking forward to CW WPX next year from Europe—G5??? . . . N8ET. Would like to see FCC reconsider issuing special event calls to promote more WPX activity with additional prefixes . . . W8RSW. Love to work DX. Total DX contacts as a Ham is over 16,000 . . . K8IQQ. A 2 hr. JA run

I had the pleasure of presenting Jack. K8YZW his '77 USA Single Operator—Single Band Trophy at the Contest Forum, '78 Dayton Hamvention. Jack, now K8XX along with Alex, WD8NLS won the 8th district honors this year in the multi—single category. (W8IMZ)

record for me . . . WB8ALP. Can't wait for the thing to start; By Saturday afternoon, I wonder why I am still there; and I don't want to see it end Sunday at 2400 GMT!! . . . W8FF. If I could hear them, I could work them—up goes a beam for next year . . . WB9SMU. JA's are super operators!! . . . K9HDE. Working on EA9 (CEUTA) with my trusty vertical . . . WØSEM. It's a shame the Clipperton group was too good for the contest . . . KØLW. It was a good test for my new beam . . . CG1RY. Worked WD8JTW as No. 1000 QSO, his No. 300—we both reached our goals at the same time!! . . . CG3HHS. Snow static bad on Mar. 26th (1.8 MHZ) . . . VE3BBN. Most contacts I have ever made in any contest . . . VE4RP. The *CQ* WPX and *CQ* WW are the best contests around . . . VE6AGV. Being asked to QSO—with three different prefixes (VE7/VC7/CG7) kind of threw me . . . VC7AZG. I will continue to subscribe to *CQ* as long as it maintains its DX Contests! . . . VE7IG. If there is going to be a BY operation it will be a Chinese operator first. Guess who? . . . VE7BC op. VE7XR. Got special prefix license to operate the contest . . . KZØDX op KZ5JM. My first *CQ* Contest . . . XF1A. I spent a lot of time explaining that WP4 is

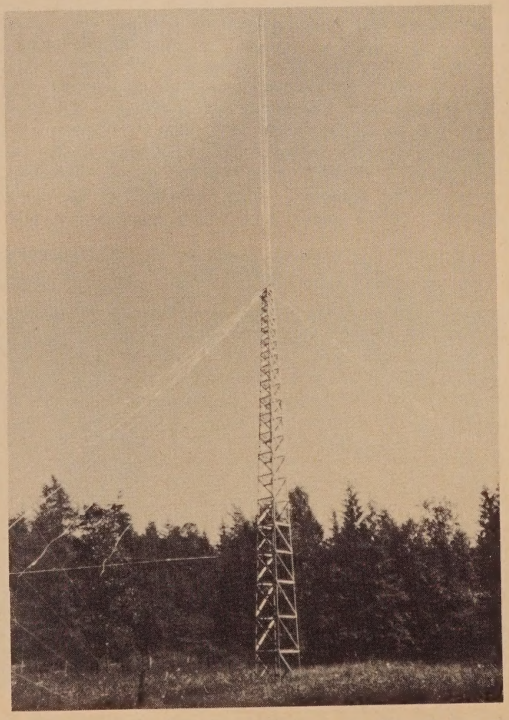

Tom, 9K2EX of Kuwait, gave many a new prefix and DX country. Very FB.

Puerto Rico . . . WP4BDL op KP4AM. Much snow, ice, and wind—it was like erecting antennas at the North Pole . . . FPØLK op WB2RLK. Celebrating Las Palmas 500th anniversary, hence the EA8Ø prefix . . . EA8ØURE. Most stations not listening for low power Africa (hi) . . . S8AHC. Very interesting to note the propagation pattern. It really was great fun . . .

This 80 meter vertical with the top at 118 feet is one of the fabulous 13 antennas at VC7WJ.

ZS6PI. Missed Bernie (W8IMZ) on 10 & 15 meters . . . VU2DK. Thanks for such a fine contest. Looking forward to many more times . . . 4Z4UX. I worked 8 new countries . . . JA4XKL. I'm very happy. I worked VP5WW . . . JH6WHN. QRM (Jamming) was very heavy (7MHz) . . . JA2BAY. I'll be on 160 next year

. . . PT7WA. WB6WTA/KG6 on Guam was so pleased to work me that my small entry was justified. . . . CEØAE. Feel fortunate to be allowed the use of HD1A—will try to reactivate the call next year . . . QSL via WA4QMQ . . . HD1A op WA4UAZ/HC1. Real participation next year—very interesting . . . FY7BC. How fast this contest has grown . . . CW3BR. This contest is a form of incentive to the country and the prefix . . . YY4YC. VE7CQX/SU never heard me although I spent hours calling him. It is still one of the best contests . . . YV5EED. Underestimated ten meter potential—wish I had gone multi op . . . VK3OT. My first WPX contest since 1971. Watch out for *BIG* Multi-Band effort in '79 . . . VK4LX. Most enjoyable as usual, age 69 now . . . VK5MF. Other than having to use a hand held mic and balance the logs on my lap in the cramped front seat of a motor home and having a vertical antenna and battery/generator power, it was a great contest and lots of fun . . . KH6WF. Never made so many contacts on one band only throughout my terms in Far East (9M2CJ, 9M6CJ, YBØACH) . . . YBØACH. I wonder how long before working 10 with a piece of wet string. Hi . . . ZL1AGO. 6 continents in 5 hrs., 35 minutes with only 15 watt (10 meters) . . . OE1SBA. Greatest WPX contest ever . . . ON4XG. Thanks for the WPX award from 1977 . . . LZ2VP. My single op score is well in excess of rivals G3WAS M-Op last year . . . G3FXB. ZK1DR a gotaway on 10M . . . G4BBA. My purpose was to get 2500 QSOs—I got 2554 . . . QI1VR. Practically no W's came thru the second day . . . OG2MM. The multiplier check is twice the contest job. Cheerio . . . OI3XZ. 4 ele. phased verticals on the ice. First night was hard—had feed line broken under ice in the water and was "boiling" sea water the whole night—Hi! . . . OF1IJ. Working CR9AJ with dipole on balcony, 1st floor, 4M from ground level . . . FØSE. Many eggs were found around the rig . . . DK8AX. I worked my first W6/VE6 on 10 meters . . . DK5WL. Only W stations are not heard on 40 meters . . . DL8QS. Most heart warming were the comments from stations who remembered the voice and asked if I was KA6YL . . . DA1GF. Special patience award for VK3BBS . . . DA1QH. 1st time I've ever worked JA's short path—look forward to participating next year . . . ZB2BL. Pleased to see 28 MHz open, lovely band to work . . . GU3YIZ. 7MHz is very QRM . . . HA3HV. Conditions great—I'm well over the 1970 European record—but somebody else did better, Hi . . . IV3PRK. Sunday, wind was blowing at over 100 MPH and suddenly, after two days in the wind, the 42 ft. boom of my 6 el beam broke just above the rotator, switched to a G.P.—what a difference! . . . I4BFY. The new prefix for my region does a very fine job in this contest . . . IN3FJT. Still only 2 PA1 stations active. No new PA1 calls from now on . . . PA1GRE. As always, the whole world was on . . . LA4MV. Rig refused to work 10 meters. Really nice to be back . . . LA5QK. Many stations "fast ops" not using call signs—we lose the time and they will have many duplicate QSOs . . . SP3DOI. Always my pleasure to use a special prefix in the contest . . . CT7UA op CT1UA. Disastrous propagation on 40 M to W/K . . . YO3BEJ. Could not work 40 & 80 because a high construction crane brought down my dipole 5 hrs. before the contest began

. . . EA1PT. There is too much splattering and compressing nowadays on SSB . . . SMØDJZ. After 1000 QSOs had to leave to go to the YU3 hamvention—came back next morning to finish contest . . . YU3EY. Nice contest with Clipperton hunting in rest time . . . YU1GMN op YU1QEF. We are very glad to operate this contest each year. All boys were ops of 4J3A in 1976 . . . UK3ABB op UV3CC. Competition with VC7WJ generated some extra energy here. Plans are to activate a new high Ground plane and to erect a stacked array for 10 meter band . . . UK9AAN op UA9AN.

TROPHY WINNERS

WORLD—Single Operator, Single Band. Jack Reichert, W3ZKH Trophy. Won by: **Rafael Ponce de Leon Z., CW3BR.** (28 MHz)

WORLD—Single Operator, All Band. North Florida DX Association Trophy. Won by: **J.R. Grebnev, UA9ACN.**

WORLD—Multi-Operator, Single Xmtr. Ted Thorpe, ZL2AWJ Memorial. Awarded by Don Miller, W9WNV. Won by: **Station KP4RF. (Oprs. KP4DSD, KP4EAJ, KP4EHO, KP4EHP, KP4ES, KP4RF).**

WORLD—Multi-Operator, Multi Xmtr. Chuck Swain, K7LMU Memorial. Awarded by Don Miller, W9WNV. Won by: **Club Station UK9AAN. (Oprs. UA9AN, UA9ACZ, UA9AEN, UA9AIS, UL7LEZ, UW9BY, and 6 Assistants).**

WORLD—QRPp. Dayton Amateur Radio Association Trophy. Won by: **Station 4T8V. (Opr. Paul M. Wyse, OA8V).**

CANADA—Single Operator, Single Band. Garth Hamilton, VE2VY Trophy. Won by: **Station CG3BMV. (Opr. Yuri Blanarovich VE3BMV).** (21 MHz)

CANADA—Single Operator, All Band. Gene Krehbiel, VE7KB Trophy. Won by: **Station CG3EUP. (Opr. Garth Hamilton, VE3EUP).**

U.S.A.—Single Operator, Single Band Joe Johnson, W5QBM Memorial. Awarded by: The Richardson Wireless Klub. Won by: **Terry Baxter, N6CW.** (21 MHz)

U.S.A.—Single Operator, All Band. Bob Epstein, K8IA Trophy. Won by: **David Donnelly, K2SS.**

WORLD—Club Competition. Bud Abraham, VE1VR Memorial. Awarded by the Canadian DX Association. Won by: **Western Washington DX Club.**

WORLD—Expedition. Contest Director's Award by Bernie Welch, W8IMZ. Won by: **Station GD5CGV. (Oprs. DF7FH, DJ3BG, DJ0UP.)**

SPECIAL CQ AWARDS—STATIONS VC7WJ, W8ILC and **LG5LG.**

North American, 28 MHz. Champion, Bill VP5WW.

DX

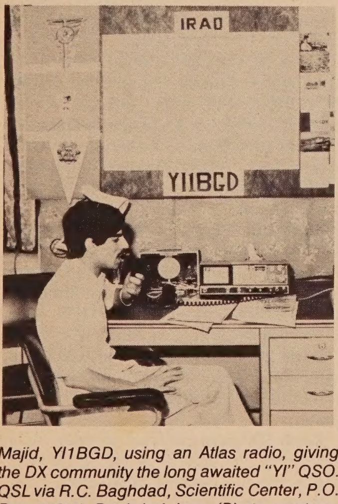

News of communications around the world

When you search your soul it's a lonely road—
That wanders the path of time,
But when you search out DX and its mysteries
There are others who want to know."
(Author Unknown)

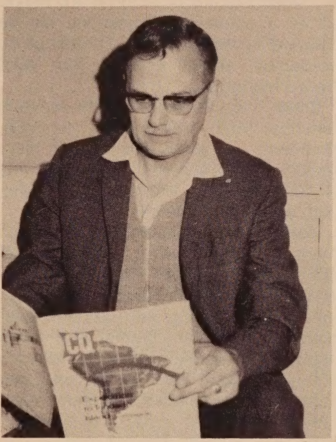

Effective Jan. 1, 1979, the *CQ* DX Department, in cooperation with the *CQ* DX Awards Advisory Committee, is announcing the most challenging DX award of the next decade *Five Band WAZ*.

Applicants who succeed in presenting proof of contact with the 40 zones of the world on the 5 high frequency bands; 80, 40, 20, 15 and 10 meters, will receive an engraved plaque in recognition of this achievement. Further, as this will be an arduous task requiring much dedication and hard work, and may be very difficult except for the most skilled and well-equipped DXers, primarily due to the problem in working all zones in the 3.5 MHz band, CQ's 5-Band WAZ will be a 2-step award. The first step will be within the capability of most DXers, the second step will be bridged with endorsement stickers.

P.O. Box 205, Winter Haven, FL 33880.

Majid, YI1BGD, using an Atlas radio, giving the DX community the long awaited "YI" QSO. QSL via R.C. Baghdad, Scientific Center, P.O. Box #5864, Baghdad, Iraq. (Photo courtesy, Harvey, W2IYX, LIDXA)

*Here is Geoff Watts reading the February, 1977 issue of **CQ** which announced his election to the prestigious DX Hall of Fame. Geoff has been Editor and Publisher of the DX News-Sheet for over 15 years and founded the Islands-On-The-Air (IOTA) award. His home QTH is in Norwich, Norfolk, England.*

The first step in the 5-Band WAZ program will be to contact and confirm 100 zones on any combination of the 80, 40, 20, 15 and 10 meter bands. For example, 40 zones on 20 meters, 40 zones on 15 meters plus 20 zones on 10 meters, or 20 zones on each of the 5 bands, or any similar combination. A handsome certificate will be awarded to each DXer submitting proof of contact with 100 zones, after which an endorsement sticker will be issued for each additional 10 zones. Beginning at the 150 zone level, an Honor Roll will be established for those intrepid DXers working toward the ultimate goal of 200 zones and a full 5-Band WAZ. Honor Roll standings may be submitted in any number.

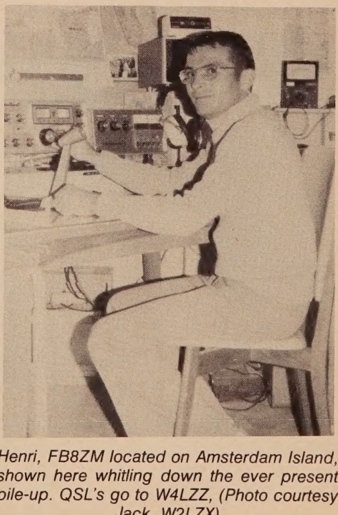

Five-Band WAZ will be offered for any combination of c.w., s.s.b., phone or RTTY contacts, mixed mode only. Separate awards will *not* be offered for the different modes. Contacts must be made after 0000 GMT, Jan. 1, 1979. Proof of contact shall consist of proper QSL cards checked *only* by the WAZ Award Manager. The following overall rules apply to the 5-Band WAZ Award Program:

1. The official CQ WAZ Zone Map, and the printed zone list which follows these rules, will be used in determining the zone in which a station is located.

2. Confirmations must be accompanied by a list of claimed zones showing the call letters of the station contacted within each zone. The list should also clearly show the applicant's name, call letters, and complete mailing address.

3. All contacts must be made with licensed, *land based,* amateur stations operating in authorized amateur bands.

4. All contacts submitted by the ap-

The complete rules for all WAZ awards are found in the May, 1976 issue of CQ. Application blanks and reprints of the rules may be obtained by sending a self-addressed, stamped envelope to the WAZ Awards Manager, 1044 S.E. 43rd St., Cape Coral, FL 33904.

plicant must be made from within the same country. It is recommended that each QSL clearly show the station's zone number.

5. Any altered or forged confirmations will result in permanent disqualification of the applicant.

6. Include with the application a $3.00 processing fee plus a self-addressed envelope with sufficient postage stamps or international reply coupons to return the QSL cards by the class of mail service desired and indicated. International reply coupons equal in redemption value to $3.00 are acceptable. (At the 1978 rate of 20¢/IRC, 15 coupons would be required.)

7. Decisions of the CQ DX Awards Advisory Committee on any matter pertaining to the administration of this award will be final.

8. All applications should be sent to the WAZ Award Manager or to CQ Magazine.

9. Zone maps, printed rules and application forms are available from the WAZ Award Manager or from CQ headquarters. Send a self-addressed, stamped envelope or a self-addressed envelope and 2 international reply coupons.

The following list of zones is presented as a guide. Any questions will be decided by the zone map. For rulings on borderline areas, consult the WAZ Award Manager.

Zone 1. Northwestern Zone of North America: KL7. VE8-Yukon, the VE8-Northwest Territories Districts of Mackenzie and Franklin, and the islands west of 102° including Victoria, Banks, Melville, and Prince Patrick.

Zone 2. Northwestern Zone of North America: VO2-Labrador, that portion of VE2-Quebec north of the 50th parallel, and a portion of the Northwest Territories-VE8 east of longitude 102°. The latter includes part of the District of Franklin and the islands of King William, Prince of Wales, Somerset, Bathurst, Devon, Ellesmere, Baffin and the Melville and Boothia Peninsulas.

Zone 3. Western Zone of North America: VE7, W6 and the W7 states of Arizona, Idaho, Nevada, Oregon, Utah and Washington.

Zone 4. Central Zone of North America: VE3, VE4, VE5, VE6, the W7 states of Montana and Wyoming, WØ, W9, W8 (except W. Va.), W5 and the W4 states of Alabama, Tennessee, and Kentucky.

Zone 5. Eastern Zone of North America; FP8, VE1, VO1, that portion of VE2-Quebec south of the 50th parallel, VP9, W1, W2, W3, the W4 states of Florida, Georgia, South Carolina, North Carolina, and Virginia, and the W8 state of West Virginia.

Zone 6. Southern Zone of North America: XE and XF.

Zone 7. Central American Zone: FO8-Clipperton, HP, HR, KS4, KZ5, TI, TI9, VP1, TG, YN and YS.

Zone 8. West Indies Zone: CM/CO. C6A, FG7, FM7, HH, HI, J3, KG4, KP4, VP2, VP5, KC4-Navassa, PJ2M/FS7, PJ2E, PJ2S, and YVØ-Aves.

Zone 9. Northern Zone of South America: FY7, HK, PJ2, PZ, 8R, 9Y4, and YV.

Zone 10. Western Zone of South America: CP, HC, HC8, and OA.

Zone 11. Central Zone of South America: PY and ZP.

Zone 12. Southwest Zone of South America: CE.

Zone 13. Southeast Zone of South America: CX, LU, VP8 and Antarctic prefixes.

Zone 14. Western Zone of Europe: CT1, CT2, DJ/DL/DM, EA, EA6, EI, F, G/GB, GD, GI, GM, GW, HB, LA, LX, ON, OY, OZ, PA/PI, PX, SM/SL, ZB2, and 3A2.

Zone 15. Central European Zone: FC, HA, HV, I, IT, IS, OE, OH, OK, SP, UA2, UP, UQ, UR, YU, ZA, ZB1/9H1, 9A1.

Zone 16. Eastern Zone of Europe; UA1, UA3, UA4, UA6, UA9-Bashkir & Chkalov, UB5, UC2, UN1, and UO5.

Zone 17. Western Zone of Siberia: UA9-Sverdlovsk, Chelyabinsk, Komi, Jurgan, Molotav, Omsk, Tyumen, plus UH8, UI8, UL7, and UM8.

Zone 18. Central Siberian Zone: UA9-Novosibirsk, Tomsk, Kamerovo, and Altai; UAØ-Krasnovarsk, Irkutsk, Chita, Bruyate Mongolia, and Dickson Island.

Zone 19. Eastern Siberian Zone: UAØ-Khabarovsk, Amur, Yakutsk, Primorsky, Sakhalin Island, Wrangle Island, and the Soviet Kuriles.

Zone 20. Balkan Zone: JY, LZ, OD5, SV, TA, YK, YO, ZC4/5B4, and 4X4.

Zone 21. Southwestern Zone of Asia: EP, HZ, MP4, 9K, VS9 (except Maldives and Socotra), YA, YI, 4W1, UD6, UF6, UG6, and AP-West Pakistan.

Zone 22. Southern Zone of Asia: AC3, AC5, CR8, 4S7, VU (except Andaman and Nicobar Islands), 9N1, and S. Bangladesh.

Zone 23. Central Zone of Asia: AC4, the BY provinces of Sinkiang, Kansu, and Hinghai, JT1, and UAØ-Tanna Tuva.

Zone 24. Eastern Zone of Asia: BY (except the provinces in Zone 23), BV,

They rolled out the red carpet in Helsinki for Doc Rosen, WA2RAU. Left to right are Doc; Miiko, OH2BAD; Leena, OH2BE (XYL of OH2BH); Martti, OH2BH; Art, WA4NTP; Ville, OH2MM; and Armes, OH2NB. After confirming YI1BGD, Doc has worked them all and WA2RAU is at the top of the Honor Roll.

Zone 38. South African Zone: ZD9, ZE, and ZS.

Zone 39. Madagascar Zone: FB8, 5R8, FR7, VQ8, VQ9, and VKØ-Heard Is.

Zone 40. North Atlantic Zone: LA-Jan Mayen, LA-Svalbard, OX, TF, and UA1-Franz Joseph Land.

The KA Callsign Problem

Since the 1940's, U.S. Forces personnel in Japan have been issued callsigns with the prefix, KA, in 2X1, 2X2, or 2X3 format by the military authorities. There are presently assigned stations using KA1, KA2, KA3, KA5, KA6 and KA8 prefixes.

In 1978, the FCC began issuing KA prefix callsigns to stations within the 48 contiguous states, resulting in a major QSLing problem. The Far East Auxiliary Radio League (FEARL), which handles cards for U.S. Forces personnel in Japan, reports that its QSL Bureau has received many QSLs for stateside KA stations. As the FEARL Bureau has only limited funds it is returning these cards to the states by bulk mail which delays their delivery.

FEARL asks that, until a permanent solution is found, all QSLs for KA stations should be clearly marked to show whether it is destined for Japan (APO or FPO address), or to a stateside station.

Anyone with suggestions for correcting or relieving this problem is asked to contact Ralph H. Fellows IL, KA2RF, Box 2785, APO San Francisco, CA 96328.

HM3LR has confirmed the Republic of Korea for many lucky DXers on both phone and c.w. If you work him, QSL via WA6OET. (Photo via K6XP)

"It's 2000 GMT and things are jumping on 20. Right on 14237 is Stan. WB2AYP in QSO with another African station. I interrupted their rag chew with 'Break, break, WB2AYP this is TT8SM, do you read? Over." No response so maybe I wasn't getting into the states after all. 'Break, break, WB2AYP this is TT8SM, do you read, over?' Then the reply, 'Stand by breaker, will pick you up in a minute.' At least I knew I was getting into the states at last. Stan and the other station kicked it back and forth another minute till finally 'OK, lets stand by and see who the breaker is, go ahead breaker.' I came back 'Roger, WB2AYP this is TT8SM, do you read? over.' For a few seconds no answer, no come back, no nothing. 'QRZ, would you please repeat your call?' And, 'Roger, Stan this is TT8SM, how do you copy?' Followed by 'TT8SM I copy you fine, but I don't believe it, a TT8 on the air.' We chatted for a while, then passed it to the other African station who was my second contact, after which we stood by to see if any other station on frequency wanted to work a TT8. I have never heard such a pileup in my life. It seemed that the whole world was on one frequency howling to work Chad. The receiver just wouldn't handle it and I finally had to shut down for some sleep after asking Stan to have a sked set up for 1900 hours Zulu the next day.

"When I came on at sked time the pack was waiting and I set out to see how many I could work in the shortest possible time. I tried every type of operation I could imagine. Lists, free for all, call areas, you name it, I tried it. Many people don't like lists, but at times that is the only way to get through to the states. The W/K's are 5 by 7 but the Europeans on the north/south path are 60/9. At those times I would take one list from the states and another list from Europe. Split frequency operation would have been much better but no equipment.

"A few times when skip was short I would have a ragchew. On one occassion a TJ, a U6, a 7X and myself had a 4-way roundtable for 30 minutes, but when

Complete rules and application forms for the CQ DX Awards Program can be obtained by sending a business size, No. 10, envelope, self-addressed and stamped to: "CQ DX Awards", 5632 47th Avenue S.W., Seattle, Washington 98136 U.S.A.

This unusual view looks over the shoulder of Helmut Baumert, DL1QT, one of Germany's most active prefix hunters and contest stations. Almost every DXer's wall has Helmut's card. (Photo courtesy Bob, K6XP)

The WPX Honor Roll

The WPX Honor Roll is based on the current confirmed prefixes which are submitted by separate application in strict conformance with CQ master prefix list. Scores are based on the current prefix total regardless of an operator's all time count. Honor Roll must be up-dated annually by addition to, or to confirm present total. If no up-date, file will be placed in "inactive" until next up-date.

we broke up there were hundreds standing by, some even tried to work all 4 of us at one whack.

"Some have questioned the different names I used. I am Scotty at home and used Scotty from 9H1. However, many Europeans seemed to find that name hard to understand and I discovered that the name 'Jack' got through very well and I used it from TT8 and 5A.

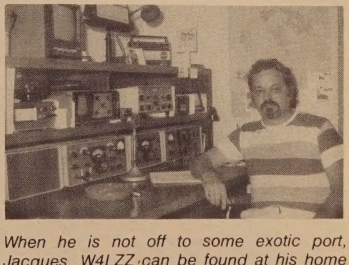

"The propagation from TT8 and 5A was very interesting. First it would open to the east coast and the W4's would come in first and stay the latest. Then the opening would move west but become progressively shorter, staying open to the 6's for only a few minutes if at all. Occasionally there would be one-way skip with stations calling on 14237 and not hearing my replies. Just before leaving I worked a few VK's by the long path.

QSL Information

The following would like to be QSL Managers for any interested DX Station:

Manny, SV1IW at his Crete Island QTH, from where he made over 2,000 QSO's on 10, 15 and 20 meters, this past July 4th. QSL via P.O. Box 3751, Athens, Greece. (Photo courtesy, Jack, W2LZX)

When he is not off to some exotic port, Jacques, W4LZZ can be found at his home QTH, digging for DX or getting QSL cards out to those who have worked, FR7BE, FB8ZM and FB8ZN, for whom he acts as QSL Mgr. When not at home, Jacques is also known as ETUSE and ST2ZZ. (Photo courtesy, Jack, W2LZX.

RTTY made easy

$149.95

with a TU-170 terminal unit

Connect to your receiver speaker, transmitter microphone jack, and teletype machine and you're on the air. State of the art design features make the TU-170 ideal for HF and VHF autostart operation at an unchallanged price.

- Proved 170 Hz shift active filter demodulator
- Lighted tuning meter for easy tuning
- Current regulated loop keyer and power supply
- Autostart with threshold control and solid state relay
- Stable audio frequency shift oscillator produces phase coherent sine wave tones
- TTL compatible inputs and outputs for auxilliary equipment
- High level output for scope tuning

WHAT'S NEW UNDER THE SUN

BY GEORGE JACOBS, W3ASK AND THEODORE J. COHEN, N4XX

THE SHORTWAVE RADIO PROPAGATION HANDBOOK

George Jacobs and Theodore J. Cohen, the two leading authorities on Propagation have teamed up to produce what will be the definitive work on this fascinating subject. For the first time anywhere, propagation is explained in simple language whereby the average reader can fully understand, use, and produce their own propagation data. This truly is must reading for the radio amateur, shortwave listener, and all others who make use of the shortwave radio spectrum.

Awards

News of certificate and award collecting

The "Story of The Month", for December as told by Walt is:

Walter G. Burdine, W8ZCV.
All Counties #147, 4-29-76.

"I am a 63 year old disability retired U.S. Civil Service "Phlunquey", a single country boy that is the proudest and happiest ham in the good old U.S.A.

"I am proud because I am a member of the ICHN and MARAC and happy because this membership accepts me as one of the greatest groups of hams in the world.

"I owe so much to so many, that in my condition I'll die badly in debt, but few are going to harbor any ill feelings.

"How can you ever pay each mobile operator that went out of his way to get you a needed county? Everyone was just as important as the other. We seem to forget that without the 2000th, there would be no 3075. Everyone was important.

SPECIAL HONOR ROLL
ALL COUNTIES

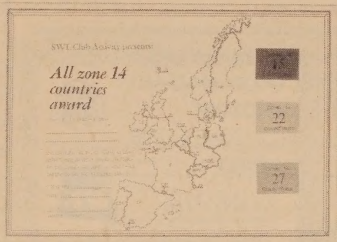

#191 John Gohndrone, N7TT 8-27-78.
#192 Alexander P. Marion, W2CUE 9-2-78.
#193 M. A. "Ukie" Urquiza, W4SWW 9-5-78.

"And thanks to all who QSLed, no QSL no county, as I found out on quite a few counties. *A confirmation is required.* By the way, there is above a 95% QSL return. A special thanks to W6CCM and WA2AEA for their QSL bureaus.

"I owe a special thanks to Ralph Alley, W9JR, Fontana, Wisconsin, who in one trip gave me the last county in 8 states—Illinois, Missouri, Mississippi, Alabama (no QSL before), Georgia, North Carolina, Virginia, and Kentucky. Meade County, Kentucky being my last county. Thanks to W8WT and WA4LSU for riding along to help on this trip, at times. Thanks also to Riley, WAØCEL for coming up with data and card for a Minnesota County that I had failed to record right, while blind with a 3 months eye operation.

*P.O. Box 73, Rochell Park, NJ 07662

"Two Bon Homme, South Dakota contacts failed with the paste board, but Robbie, K4RQX, offered to drive from Houston to get that one. Bob, WØKMH got it, sent a card, and I finally received Worked All USA Counties #147, April 29, 1976.

Worked All Zone 14 Countries Award—WAZ14CA.

"I worked K1VSJ in all Rhode Island Counties and K5VYT in all New Mexico Counties.

For a diabetic with 8 heart attacks, near blind and deaf, do you think I'll ever be able to pay off? I'll be pitching though. 73 & 88, Walt."

Awards Issued

John Gohndrone, N7TT—N7TT/W2 (W9IRH and ex-W7KWC) finally decided to catch up on his paper work (he had

Worked "Laen W" Award—WLW.

USA-CA-500-#151 12-16-62) and he acquired USA-CA-1000 through 2500 endorsed all SSB, all mobiles, all 14 MHz. Also USA-CA-3000 endorsed all SSB, all mobiles, and all counties, Mixed.

Alex Marion, W2CUE, as he put it, in just under 25 years, also made all counties.

Ukie Urquiza, W4SWW (now in California) found time to apply for USA-CA-3000 and all counties.

Bob Lamberton, WA3QNT was issued USA-CA-2500.

Jack Johnson, WD9AXF added USA-CA-1500 and 2000 to his collection.

Dave Bishop, WB9QNX claimed USA-CA-1500.

Ernest Gutermann, K6CR applied for USA-CA-1000 endorsed all A-1.

Nathan Rosen, W2-6893 (SWL) collected USA-CA-500 and USA-CA-1000.

USA-CA-500 Certificates, endorsed Mixed. went to:

Derrick Webber, G3LHJ.
Stephen Bird, WA7LHZ.
Arthur Geyer, ZF2AG, #1 to ZF—Cayman Island.

Note: For full information on above Awards, send s.a.s.e. to Custodian.

The WB9RCY/Mobile Plaque: A plaque is now available to any United States or Canadian Amateur Radio Station for confirmed contacts with ARS WB9RCY/Mobile in 500 Counties. The same plaque is available to other DX stations for confirmed contacts in 200 Counties.

Canadian Provinces, Forests, Government Districts, Municipalities and Counties may be counted along with United States Counties.

Send a list of Counties worked and confirmed, listed consecutively by date, with your signature. There is no charge to the recipient for this plaque, and dates of contacts may be any time after October 26, 1976. Dorothy says: "Thank you for riding along with us, we enjoy your company. At this time #1 went to my OM, Wayne N9WA (he does all the driving on our trips, so I decided he should have #1 with special qualifications). Number 2 went to WA6MAR, #3 to W7KOI, #4 to WA1UVX, and #5 went to WA2WCW".

Worked ITU Zones 17/18 Award—W-ITU-Z17/18-A.

SWL Club Activity Awards Program (Sweden): All awards available to radio amateurs and SWLs.

Worked "Laen W" Award (WLW): The Award is issued in four (4) classes:
Class A: European stations work 20 stations in "Laen W".
Rest of the world work 15.
Class B: European stations work 15.
Rest of the world work 10.
Class C: European stations work 10.
Rest of the world work 6.
Class D: European stations work 5.
Rest of the world work 3.
Send application with GCR (General Certification Rule) and 10 IRCs or 2 U.S. dollars ($2.00) to: SWL Club Activity, Fack 55, S-780 40 Mockfjard, Sweden. Stickers for Classes C, B, and A cost 2 IRCs each. List showing "Laen W" stations for 1 IRC.

Worked All Zone 14 Countries Award (WAZ14CA): The Award is issued in three (3) classes.
Class A: Work 27 Countries in CQ Zone 14.
Class B: Work 22 Countries.
Class C: Work 15 Countries.
Send application with GCR and 10 IRCs or 2 US dollars ($2.00) to SWL Club Activity, Fack 55, S-780 40 Mockfjard, Sweden.
Stickers for Classes B and A cost 2 IRCs each.
Countries located in CQ Zone 14 are: CT1, CT2, C31, DA/DF/DJ/DK/DL, DM, EA, EA6, EI, F, G, GD, GJ, GM, GU, GW, HB9, HBØ, LA, LX, ON, OY, OZ, PA/PI, SK/SL/SM, ZB2, 3A, 4U/Geneva.

Worked ITU Zones 17/18 Award (W-ITU-Z17/18-A): The award is issued in three (3) classes.
Class A: Work all Countries in ITU Zones 17/18.
Class B: Work 7 Countries (must include TF).
Class C: Work 5 Countries.
AOM/B endorsements.
Send application with GCR and 10 IRCs or 2 US dollars ($2.00) to: SWL Club Activity, Fack 55, S-780 40 Mockfjard, Sweden.
Countries located in ITU Zones 17/18 are:
ITU Zone 17: TF.
ITU Zone 18: JW, JX, LA, OH, OHØ, OJØ/OHØM, OY, OZ, SM.
Amateur Radio Stations in "LAEN W" for WLW AWARD, stations were active as of December 1977 and earlier:
SK4: AO, BW, DM, EO, GW, GJ.
SL4: BP, ZH.
SM4: AHG, AJG, AK, ALB, AMC, AMM, ANK, ANQ, ANU, ANV, AOH, AQL, ARJ, ASI, ATR, AUU, AVP, AWF, AWU, AZA, AZJ, BEL, BGT, BJX, BPD, BPU, BQA, BRX, BTJ, BVC, BZN, CBO, CGM, CGP, CHM, CIM, CJM, CLR, CNN, CQQ, CSF, CUJ, CUQ, CUW, CVS, CYO, CYR, DAQ, DAT, DFD, DFH, DHO, DIG, DJO, DN, DNX, DOG, DQE, DQM, DWA, DWP, DY, EDK, EEA, EGD, EIK, EJR, EJT, EJZ, ELM, ENH, EPK, EPR, EQR, ERY, ESA, ETB, ETF, ETO, EWO, EWP, EWS, EXN, EXZ, EZG, FCD, FDV, FEO, FGE, FGZ, FHV, FIV, FJK, FJV, FKE, FKK, FLK, FOC, FPH, FPO, FPR, FTM, FTQ, FVL, FXQ, FZC, FZQ, GAU, GDB, GDN, GF, GFL, GGD, GGI, GHK, GIB, GIJ, GIS, GJS, GJT, GL, GND, GO, GOT, GTB, GTK, GWI, GX, GYN, GZK, GZS, HCF, HCG, HCM, HFI, HHO, HIX, HLB, HMH, HOD, HQE, HVK, HVP, HW, HSY, HTV, IAS, IAW, ICY, IED, IGL, IJ, IKX, IL, IO, IRB, IRX, ISJ, INN, IWD, IXW, JD, KF, KM, KW, KZ, MD, OJ, RR, TD, TO, TU, WQ.
SM4-/P: AIO, AW, AWC, AWD, AWV,

BMA, CEZ, CTI, DMD, DXO, EFW, EHV, ENS, FMT, FVE, JN, RQ.

Notes

Regarding MARAC, Tom, WAØYJL is now Awards Custodian, and Bob, WAØYJL is Editor of the Newsletter.

Sorry to report the passing of Harry McNutt, K8KOM on September 1. As many of you know, Harry was one of the early members of the original 40 meter County Hunters Net. Story and photograph of Harry on page 98 of *CQ* of July 1967. Thanks to Walt, W8NXN for the information.

Well it appears that the Nortown Amateur Radio Club has again fallen behind on issuing their awards. It seems that periodically they have custodians who do *not* take care of things . . . but then bad publicity gets them back on track. So, fellows get going!

Here is the strange story about Bill Shannon, who apparently fooled many of us, even the FCC, for awhile. At one time he apparently had the call as a Novice, of WA6GFH, but since then he has *used* the calls of W6VK, W6NV, which are genuine calls but *not* assigned to him and the holders are *not* County Hunters. He also used KL7NV. In 1975 he applied and

Julio, CT1ZW and Ad, CT1RM.

received USA-CA-500, 1000 and 1500 as W6VK, he also had 10-X-#3157, YLSSB #8956 and MARAC #660. He also did some mobile work and DX-pedition work so *do not* use W6VK, W6NV, or KL7NV QSOs for your USA-CA Applications. Thanks for the several who passed the data to me.

Well here it is again, just about the end of 1978. It has been a good year for County Hunters and also DXers.

Let us make 1979 an even better year, and I hope Santa Claus brings all the QSLs and new equipment you desire. How was your month/year?

73, Ed., W2GT.

A BREAKTHROUGH IN SWR AND RF POWER MEASUREMENT*

SWR OR RF POWER DISPLAYED THE INSTANT RF HITS THE COAX!!

The ERC Model SL-65 Instantaneous Digital SWR and RF Power Meter is a laboratory quality instrument that adds a new dimension in SWR and RF POWER measurements. State-of-the-art technology provides not only instant SWR readout **without calibration** and NET PEP readout, but provides these measurements EVEN UNDER SSB MODULATION AND CW GREATER THAN 10 WPM.

SWR METER SPECS

Two digit readout displays SWR measured from 1.0 to 6.3 automatically to within 0.1 for power levels from nominally 20 to 2000 watts even under SSB modulation

Frequency range of 1.8 to 30 MHz

Insertion SWR negligible under 30 MHz

NUMERALS SHOWN ARE SIMULATED

RF POWER METER SPECS

Displays NET PEAK POWER from nominally 20 to 2000 watts in two autoranged scales

Two digit readout displays output power from 20 to 500 watts in 10 watt increments and 500 to 2000 watts in 100 watt increments

Frequency range of 1.8 to 30 MHz

SL-65
Instantaneous Digital
SWR and NET POWER Meter
(3.5X5.5X7.5 inches)

Fully self contained with 115Vac power supply. The Model SL-65 Instantaneous Digital SWR and RF Power Meter may be used with any HF transmitter providing an output power level of 20 watts to beyond the amateur legal limit. The instrument is connected in-line with the transmission co-ax (50 ohms nominal). A display selection switch permits a choice of direct SWR readout (1.8, 2.1, etc.) or NET PEAK ENVELOPE POWER. Display does not flicker in either mode for AM, FM, RTTY, SSTV, normal speech rate in SSB or CW greater than 10 WPM.

Instant and direct SWR readout whenever you modulate

Independent of power level so that calibration (power set) is not required

Direct readout of actual power accepted by the load, so that you know what the antenna gets.

Displays PEP instantly when you modulate

FULLY WIRED AND TESTED

NET: $189.50 **Model SL-65 available in Collins Gray cabinet and dark gray wrinkle panel.**

* Patent pending

QRP Model soon. Watch for the SL-65A

The complete receiver audio active filter
YOU CAN DO IT SIMULTANEOUSLY with both NOTCH and BANDPASS filters.

The ERC Model SL-55 Audio Active Filter is designed to improve SSB and CW reception under the most severe cases of QRM. Containing independent and continuously variable bandpass and notch filters, both may be used simultaneously to enhance reception. Both filters are of the biquad design since this filter realization is inherently stable and virtually ring free even when the highest Q's are selected.

NOTCH FILTER SPECS

Notch frequency positioning continuously variable from nominally 300 to 1400 Hz.

Notch depth fixed at no less than 30 dB

3 dB notch width 50 Hz low end, 200 Hz high end

May be disabled completely

BANDPASS FILTER SPECS

Center frequency positioning continuously variable from nominally 200 to 1400 Hz

Bandpass continuously variable in width from 14 Hz to greater than 1400 Hz — 3 dB, 140 to greater than 1400 Hz — 20 dB

Bandpass controls are completely independent of notch controls

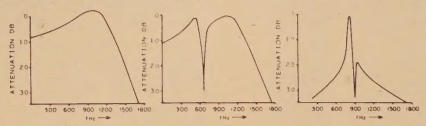

SL-55
Audio Active Filter
Both filters are cascaded with a fixed lowpass filter (18 dB/octave rolloff above 1400 Hz) for optimum SSB filtering. (3.5x5.5x7.5 inches)

Fully self contained with 115 Vac power supply, the Model SL-55 audio active filter may be used with any communications receiver or tranceiver designed for SSB and/or CW reception providing output to an eight ohm speaker or headphone. The filter requires no modification to any receiver. It is connected in series with the audio output line to the speaker or headphones and will drive nominally one watt to an eight ohm load and headphones from 8 to 2000 ohms.

A front panel BYPASS switch restores the receiver (tranceiver) to its original audio configuration.

HERE ARE THE PERFORMANCE CURVES

SSB	SSB	CW
Notch off	Notch at 700 Hz	Notch at 900 Hz
Bandpass freq at 3 o'clock	Bandpass freq at 3 o'clock	Bandpass freq at 800 Hz
Bandpass Q at full CCW	Bandpass Q at full CCW	Bandpass Q at full CW

Propagation

The science of predicting radio conditions

The Swiss Federal Solar Observatory at Zurich reports a monthly mean sunspot number of 56.7 for August, 1978. Daily values ranged from a low of 26 on August 21st to a high of 100 observed on the 31st. This monthly level of solar activity results in a 12-month smoothed sunspot number of 63, centered on February, 1978. The sunspot cycle is measured by the level of smoothed sunspot number, and the present cycle continues to increase at a relatively rapid pace.

A smoothed sunspot number in the high 90's is expected during December.

The present cycle, Cycle 21, began during March, 1976. The smoothed sunspot numbers recorded during its first two years are shown below.

Progress Of Sunspot Cycle 21

Date	SSN
March, 1976	12

LAST MINUTE FORECAST

Day-to-Day Conditions Expected for Dec., 1978

Propagation Index	Expected Signal Quality (4)	(3)	(2)	(1)
Above Normal: 5, 9-10, 22, 31	A	A	B	C
High Normal: 3-4, 8, 12, 21, 29-30	A	B	C	C-D
Low Normal: 1-2, 6-7, 11, 17-18, 20, 23, 26-28	B	C	D	D-E
Below Normal: 13, 15-16, 19, 24-25	C	D	D-E	E
Disturbed: 14	C-E	D-E	E	E

Where *expected signal quality is:*

A—Excellent opening, exceptionally strong, steady signals greater than S9+30 dB.

B—Good opening, moderately strong signals varying between S9 and S9+30 dB, with little fading or noise.

C—Fair opening, signals between moderately strong and weak, varying between S3 and S9, with some fading and noise.

D—Poor opening, with weak signals varying between S1 and S3, and with considerable fading and noise.

E—No opening expected.

HOW TO USE THIS FORECAST

1. Find *propagation index* associated with particular band opening from Propagaion Charts appearing on the following pages.
2. With the *propagation index*, use the above table to find the expected signal quality associated with the band opening for and day of the month. For example, an opening shown in the charts with a *propagation index* of 3 will be good (B) on the 3rd and 4th, excellent (A) on the 5th, etc. Conditions during the CQ WW CW DX Contest should be above normal on Nov. 25 and low normal on the 26th.

For updated information dial Area Code 516-883-6223 for DIAL-A-PROP, subscribe to bi-weekly MAIL-A-PROP, P.O. Box 1714, Silver Spring, MD 20902.

December should be an excellent month for DX propagation conditions. Expect seasonally higher daytime frequencies and improved DX conditions to many areas of the world on *6, 10, 15* and *20* meters during the hours of *daylight*. There are longer hours of darkness during December and considerably lower static levels, which should result in improved DX conditions on *40, 80* and *160* meters to many areas of the world during the hours of *darkness*.

The present sunspot cycle has risen to a level where fairly frequent 6 meter F-2 layer DX openings can be expected during December. The band should peak towards Europe and in an easterly direction an hour or two before Noon, towards Africa at about Noon, towards Central and South America and the Caribbean area during the early afternoon, and towards the Pacific, Australasia and the Far East during the late afternoon. Best days on which to expect *6* meter DX openings are those expected to be High or Above Normal.

Expect *10* meters to open to most areas of the world when conditions are at least Low Normal, with some exceptionally good openings possible when conditions are High or Above Normal. At times, signals may reach exceptionally strong levels. Signals should peak towards Europe, Africa and in an easterly direction before Noon, towards Central and South America and the Caribbean area during the early afternoon, and towards the Pacific, Australasia, the Far East and Asiatic areas during the late afternoon.

Look for exceptionally good DX openings on *15* meters to all areas of the world when conditions are Low Normal or better. The band will probably open to many southern and tropical areas even when conditions are Below Normal. This is a daytime band, with signals peaking about an hour or so after they have peaked on *10* meters, from the same geographical areas.

Expect good openings on *20* meters to just about every area of the world during a two-to-three hour window beginning at sunrise, when conditions are Low Normal or better. Signals should peak again towards Europe and in an easterly direction around Noon, towards Africa during the late afternoon, towards Central and South America and the Caribbean area during the late afternoon and into the early evening, towards the Pacific area, Australasia, the Far East and Asiatic regions during the early evening and towards Antarctica and other extreme southern areas during the evening to about 10 p.m. When conditions are High or Above Normal, expect the band to remain open somewhat longer to each geographical area. Look for openings

towards southern and tropical regions even during periods of radio storminess.

Good DX openings on *40* meters should begin during the late afternoon and continue through the hours of darkness, until shortly after sunrise. The first signals should come from Europe and an easterly direction several hours before sundown, and they should peak an hour or two before Midnight. After sundown, signals from Africa, Central and South America and the Caribbean area should gain considerably in strength. Signals from the Pacific area, Australasia, the Far East and Asiatic regions should begin to pick up in strength an hour or so after Midnight, and peak just before local sunrise.

Good DX openings to most areas of the world are also expected on *80* meters between the sundown and sunrise period. Signals should peak at about the same time that they do on *40* meters, from similar geographical areas, but they will often be weaker and noisier.

December should be a good month for *160* meter DX conditions. The band should open towards Europe and in an easterly direction beginning about 8 p.m. in all time zones, and lasting until about 2 a.m. in the EST zone; 1 a.m. in CST; Midnight in MST and 11 p.m. in PST. Some openings towards the south, particularly to Central America and the Caribbean area, are possibly also to the northern countries of South America, should be possible from about 10 p.m. to 2 a.m. in all time zones. Openings towards the Pacific, Australasia and the Far East favor west coast stations, but it's worth the time to look for these openings in all time zones between 4 a.m. and sunrise. Remember the old rule of thumb for *160* meter DX openings; conditions peak about the time that the sun begins to *rise* at the *easternmost* terminal of a DX path.

For *short-skip* openings during December of less than 250 miles, try both *80* and *40* meters during the day, and *80* and *160* meters at night. For openings between 250 and 750 miles, *40* meters should be best during the day, and both *80* and *160* meters at night. Between 750 and 1300 miles, try *20* during the day, *40* meters during the early evening, and *80* later in the evening and until the sunrise period. Try *40* meters again for about an hour or so after sunrise. For openings between 1300 and 2300 miles, *20* meters should be best during most of the daylight hours, with *15* meters not too far behind, and with *10* meters running a close third. Try *40* meters during the early evening and until an hour or two after Midnight, then check *80* meters until sunrise. Try *40* meters again for an hour or so after sunrise.

V.h.f. Ionospheric Openings

Big news this month should be the F-2 layer DX openings expected on *6* meters during the hours of daylight. Best times to check for these openings have been given earlier in this column. A secondary seasonal peak in sporadic-E ionization should also result in some short-skip openings on this band between distances of approximately 800 and 1300 miles.

Trans-equatorial scatter, or TE openings on *6* meters should fall off somewhat during December, but some openings should still be possible between the southern half of the USA and deep South America. TE openings generally take place during the evening hours, and they usually peak between approximately 8 and 11 p.m.

Expect quite an upturn in meteor activity during December. *Geminids,* a major meteor shower, should begin on December 13 and last for about three days. Maximum intensity is expected at approximately 4 a.m. EST on December 14, with an expected meteor rate of about one a minute. This should permit fairly good meteor-type communications on both *6* and *2* meters. A second, but somewhat less intense shower called *Ursids,* is expected later in the month. It

HOW TO USE THE DX PROPAGATION CHARTS

1. Use Chart appropriate to your transmitter location. The Eastern USA Chart can be used in the 1, 2, 3, 4, 8, KP4, KG4 and KV4 areas in the USA and adjacent call areas in Canada; the Central USA Chart in the 5, 9 and 0 areas; the Western USA Chart in the 6 and 7 areas, and with somewhat less accuracy in the KH6 and KL7 areas.

2. The predicted times of openings are found under the appropriate meter band column (10 through 80 Meters) for a particular DX region, as shown in the left hand column of the Charts. An * indicates the best time to listen for 160 meter openings.

3. The *propagation index* is the number that appears in ( ) after the time of each predicted opening. The index indicates the number of *days* during the month on which the opening is expected to take place as follows:

(4) Opening should occur on more than 22 days
(3) Opening should occur between 14 and 22 days
(2) Opening should occur between 7 and 13 days
(1) Opening should occur on less than 7 days

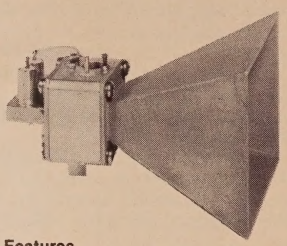

Refer to the "Last Minute Forecast" at the beginning of the Propagation column for the actual *dates* on which an opening with specific propagation index is likely to occur, and the signal quality that can be expected.

4. Time shown in the Charts are in the 24-hour system where 00 is midnight; 12 is noon; 01 is 1 A.M., 13 is 1 P.M., etc. Appropriate *standard* time is used, *not* GMT. To convert to GMT, add to the times shown in the appropriate chart 8 hours in PST Zone, 7 hours in MST Zone, 6 hours in CST Zone, and 5 hours in EST Zone. For example, 13 hours in Washington, D.C. is 18 GMT. When it is 20 hours in Los Angeles, it is 04 GMT, etc.

5. The charts are based upon a transmitter power of 250 watts c.w., or 1 kw, p.e.p. on sideband, into a dipole antenna a quarter-wavelength above ground on 160 and 80 meters, and a half-wave above ground on 40 and 20 meters, and a wavelength above ground on 15 and 10 meters. For each 10 db gain above these reference levels, the *propagation index* will increase by one level; for each 10db loss, it will lower by one level.

6. Propagation data, contained in the Charts has been prepared from basic data published by the Institute For Telecommunication Sciences of the U.S. Dept. of Commerce, Boulder, Colorado, 80302.

GUNNPLEXER™ TRANSCEIVER
"FRONT END" BY MICROWAVE ASSOCIATES

Features
- Low Cost • High Sensitivity
- Integrated Assembly • Electronically Tunable • High Reliability
- Low Operating Voltage

THE GUNNPLEXER SYSTEM
The fascination of amateur microwave is unique. Microwave systems have an 'exotic' ring to them. Until the appearance of the Gunnplexer, getting into microwaves required either a six foot rack of surplus gear or a friend on the inside of a microwave hardware supply company. The Gunnplexer has changed all of that; now you don't need any friends in the microwave business (in fact it may be better if you don't have any prior microwave knowledge because the Gunnplexer pretty much throws away the book on standard microwave design practices!)

Equally fascinating is the wide band capability of the microwave region. The 10 GHz assignment has spectrum-space for 111 **simultaneous** video (4.5 MHz wide) channels. Try that even using SSTV in the 20 meter assignment.

The bottom line on microwaves is simply that it will do much more communicating than you might first suspect.

TWO-WAY COMMUNICATIONS
The primary application of the Gunnplexer "front end" is for 2-way communications. Two units, one a transmitter and the other a receiver down converter, are used with their carrier frequencies off-set to provide a reasonable IF (30 MHz or higher). Applications range from linking remote receivers to VHF repeaters, transmitting color video, linking homemade computers, full duplex mountain top DXing or over water duct DXing. A separate power supply and simple FM modulator must be provided; the MA-86551 (17 dB) horn antenna (shown here) is suggested.

WHY A GUNNPLEXER?
Amateur microwave communication is fascinating and challenging. Now with the revolutionary MICROWAVE ASSOCIATES Gunnplexer front end this exotic form of communications is available to virtually anyone. And at an unbelievably low cost!

MA-87141-1 2 Complete Gunnplexer transceivers (MA-87127-1, 15mW typical and 2 horn antennas MA-86551, 17dB) just $199.95 plus $2.00 shipping and handling.

CIRCLE 27 ON READER SERVICE CARD

should take place on December 22 and 23, with its peak occurring at about 7 p.m. on the 22nd. A meteor rate of approximately 15 an hour is expected during the peak period.

There is a good possibility for unusual short-skip openings on both 6 and 2 meters during auroral activity that is likely to occur when conditions are either Below Normal or Disturbed. Check the "Last Minute Forecast" at the beginning of this column for those days during December that are expected to be in these categories.

The Editor of this column would like to take this opportunity to extend his warmest wishes to readers everywhere, for a Merry Christmas and a very Happy New Year.

ITS WHAT YOU CAN'T HEAR THAT MAKES YOUR QSO Q5

The Frequency-Agile FL-1 is totally unique in that it will automatically scan the 280—3,000 Hz audio spectrum, and when sensing interfering heterodynes, CW or RTTY signals, rejects them up to 40 DB!

NOTCH-MODE OPERATION

During your SSB/SSTV operations, the Frequency-Agile FL-1 AUTOMATICALLY scans, locks, and tracks interference within the 280-3000 Hz. spectrum, and in a second or two reduces QRM up to 40 db!
For CW/RTTY usage, fully INDEPENDENT control of bandwidth and center frequency provide rejection of interfering signals up to, or greater than 40 db.

PEAK-MODE OPERATION

The SSB/SSTV operator, using the fully INDEPENDENT controls of the FL-1, can precisely tailor the audio response; reducing or eliminating adjacent channel splatter or SSTV QRM. The CW/RTTY operator can adjust bandwidth down to 25 Hz rejecting virtually all interference to the desired signal. Often, the AUTOMATIC and AFC features of the FL-1 are desirable when in this mode.

$179.95
including Pre-Paid shipping & full insurance

- Made in England
- Full 1 year warranty
- VISA-MASTERCHARGE accepted

GENERAL SPECIFICATIONS

- Size: 8"W, 3"H, 5.5"D
- Requires 9-16 VDC from either internal battery or external supply (not included)
- Installs easily in your audio line between your receiver and speaker
- Highest quality construction—2 glass circuit boards, 8 I.C.s, 6 Transistors, 8 Diodes, 2 LEDs.

Dedicated to Excellence

AR Technical Products Corp. (Exclusive Importers of DATONG FL-1's)

How You Can Convert Your Rohn 25G Tower to a FOLD-OVER

CHANGE, ADJUST OR JUST PLAIN WORK ON YOUR ANTENNA AND NEVER LEAVE THE GROUND.

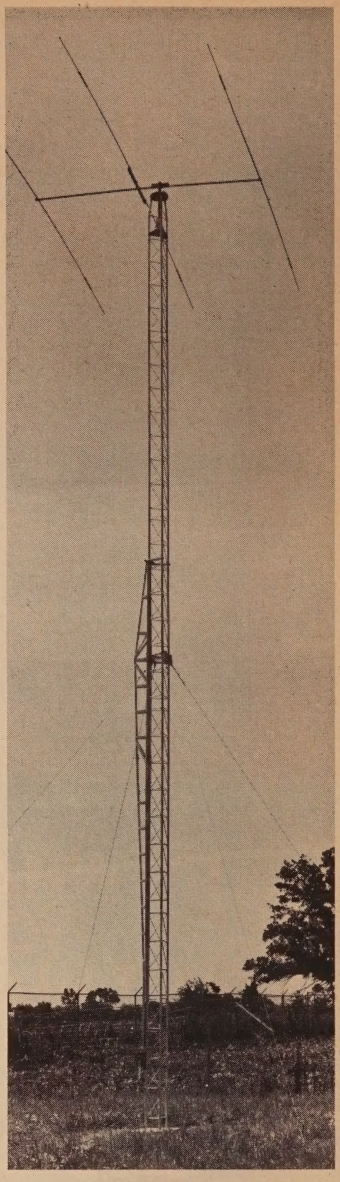

If you have a Rohn 25G Tower, you can convert it to a Fold-over by simply using a conversion kit. Or, buy an inexpensive standard Rohn 25G tower now and convert to a Fold-over later.

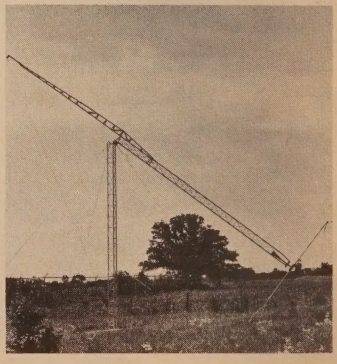

Rohn Fold-overs allow you to work completely on the ground when installing or servicing antennas or rotors. This eliminates the fear of climbing and working at heights. Use the tower that reduces the need to climb. When you need to "get at" your antenna . . . just turn the handle and there it is. Rohn Fold-overs offer unbeatable utility.

Yes! You can convert to a Fold-over. Check with your distributor for a kit now and keep your feet on the ground.

AT ROHN YOU GET THE BEST

Do not attempt to raise antenna or antenna support near power lines—You can be KILLED.

CIRCLE 48 ON READER SERVICE CARD

a monthly feature by

FRANK ANZALONE, W1WY

Contest Calendar

News/views of on-the-air competition

My comments this month will be very brief. About the time I was preparing this Column I was put out of circulation by a week's stay in the hospital and the convalescing period that followed.

A few complaints have been received from contestants in the 1977 WW DX Contest that their scores were not listed in the results. Sorry fellows, if your call was not listed we just did not receive your log.

With the deterioration of the postal service it is most important that you get your logs in the mail as soon as possible. Air Mail is a must for overseas entries in order to beat the Holiday rush.

As a suggestion, bulky stateside multi-multi entries might try United Parcel Service. I have found them most reliable.

Normally we would be running the CQ 160 Contest rules in this issue but find it impossible to do it this year. However they will be given in details next month which will still give you plenty of time before the contest.

The dates are firm, 2200 GMT Friday January 26 to 1600 GMT Sunday January 28. Rules will be the same as they have been these past many years. The only questionable items at this time are the trophy donors.

Best wishes for the coming Holidays.

73 for this time, Frank, W1WY

Spanish DX Contest

Phone: Dec. 2-3 C.W.: Dec. 9-10
Starts: 2000 GMT Saturday
Ends: 2000 GMT Sunday

It's the world working the Espanoles on phone and c.w. in this one. This year for the first time phone has been included and will be held on a separate week-end.

Only single operator operation is permitted on all bands 3.5 thru 28 MHz.

Exchange: RS(T) plus a three figure QSO number starting with 001.

Scoring: Contacts between EA stations and the Phillipines and Hispano-american countries are worth 3 points. Following prefixes will be considered 3 pointers. DU, CE, CM/CO, CP, CX, HC, HI, HK, HP, HR, KP4, LU, OA, PY, TG, TI, XE/XF, YN, YS, YV, ZP or equivalent prefixes.

Between EA and all other non-Hispano and non-European countries 2 points.

Between EA and Europeans 1 point. (WAE boundries.)

Multiplier: For EA, each DXCC country worked on each band. All others use EA call districts worked on each band.

Final Score: Total QSO points from all bands times the sum of the multiplier from each band.

Awards: Gold, Silver and Bronze medals to the first 3 place winners, phone and c.w., in Spain and overseas stations. And certificates to first place winners in each country. A minimum of 100 points required to qualify.

Include a summary sheet with your log showing the scoring and other pertinent information, the usual signed declaration that rules and regulations have been observed, and your name and address in Block Letters.

Your entry must be postmarked no later than Feb. 15th to: U.R.E. International Contest, P.O. Box 220, Madrid, Spain.

† Not official

ARRL 160 C.W. Contest

Starts: 2200 GMT Fri., December 1
Ends: 1600 GMT Sun., December 3

This will be the 9th annual Top Band Contest organized by the ARRL. Activity will be between state-side stations, VE's and also DX. However, DX to DX does not count.

Exchange: RST and your ARRL section or country if it's a DX station.

Scoring: Contacts between stations in ARRL sections earns 2 points, with other areas 5 points. The multiplier is determined by the number of ARRL sections worked, (74 possible) plus VE8 and each DX country.

Awards: Certificates to top scorers in each section and each country.

Keep the DX Window (1825-1830) clear of state-side operation, that's where you will find the DX stations calling. They will be listening 1800-1805 or on frequencies they specify. Look for KH6's at the top of the band, 1995-2000. They also will be listening down at the low end. (KH6's are also permitted to operate in the 1800-1810 segment.)

LOOK OUT
The FINCO Stingers are here!

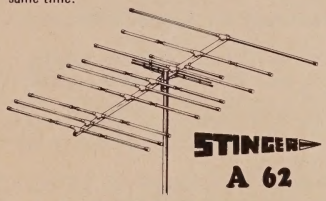

The "Rugged" ones From FINCO Amateur Beams

- Withstands High Winds and Ice Loading
- Gamma Matched
- Easily Withstands 2,000 Watts P.E.P.

STINGER A 2+2

The model Stinger A 2+2 is a ten-element dual polarization 2–meter antenna designed for OSCAR communications or where switching from horizontal to vertical polarization is required. The A 2+2 can even be phased to operate on both horizontal and vertical polarization at the same time.

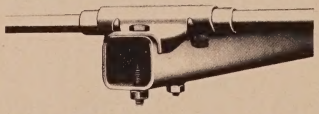

STINGER A 62

The model Stinger A 62 is a truly remarkable combination 6 and 2-meter beam designed for optimum performance on both bands yet only requiring ONE transmission line. This is accomplished through the use of exclusive phasing elements to accomplish dual band operation with no sacrifice to either band – NO SWITCHING REQUIRED!

Other Frequencies Available. . .
▪ 10 Meter ▪ 6 Meter ▪ 2 Meter ▪ 1 1/4 Meter

Features

Exclusive Stinger square boom construction is used on all amateur antennas. The 1 1/4" square booms are of .064 wall high tensile strength aluminum which is many times stronger than its round counter part. Special bracket assemblies have been developed to allow instant element to boom alignment – plus they stay aligned in the highest wind and ice loads.

AMATEUR CB TV ANTENNAS FINCO ACCESSORIES MATV/CATV

THE FINNEY COMPANY

34 West Interstate Street, Bedford, Ohio 44146
(216) 232-6161

FINCO, the Champion of all Electronic Independent Service!

Don't overlook the 1830-1850 portion of the band, activity there is usually much lighter than the bottom 25 kHz. (Check U.S. 160 Regs. for availability and restrictions.)

The usual grounds for disqualification; violation of rules, excessive duplicate contacts etc. will prevail. A large s.a.s.e. to ARRL will get you the necessary forms to make log keeping easier.

All entries must be postmarked no later than Dec. 29, 1978 and go to: ARRL Communications Dept., 160 Contest, 225 Main Street, Newington, Conn. 06111.

International Island Contest

Starts: 0001 GMT Sat. December 2
Ends: 2400 GMT Sun. December 3

This is a new one organized by the Whidbey Island Amateurs, but unfortunately it has been scheduled on an already overcrowded weekend.

Rules are rather lengthy and detailed and it is necessary for you to have a IDX island list to score your log. Therefore it is recommended you send a s.a.s.e. to WB7BFK for details.

The following are the rules in brief.

Operation can be made by both single and multi-operator, all bands, phone and c.w.

Winners of 1978 Bermuda Contest

VP9IB	1,246,080
GW3NWS	235,480
K1DG	91,905
VE3BMV	78,515

Exchange: RS(T) and DXCC country or IDX island for those on the island list.

Scoring: One point for DX contacts, 10 points if it's an IDX island. Each IDX island worked on each band counts as a multiplier. (A station may be worked only once for QSO points regardless of the band or mode.)

Power Multiplier: 100 watts input or less, multiplier of 4. A multiplier of 2, if input is 101 to 299, 1.5 if it's 300 to 499 watts, none if 500 or over.

Final Score: Total QSO points × Island multiplier × power multiplier.

Awards: For each mode and class, to top scorers in each U.S. State, VE province, DXCC country and each IDX Island.

Mailing deadline for logs is January 4th to: Bill Gosney, WB7BFK, 2665 N. 1250 East, Oak Harbor, Whidbey Island, Wash. 98277. Include a large s.a.s.e. or 3 IRCS for DX.

Telephone Pioneers QSO Party

Starts: 1900 GMT Sat. December 2
Ends: 0500 GMT Mon. December 4

This is the 14th annual party sponsored by the Stanley S. Holmes Chapter in which telephone pioneer amateur operators will be able to contact other members in the United States, Canada and in foreign countries. (F2CA will be looking for stateside QSOs.)

Exchange: Contact number, chapter name and number.

Scoring: One point for each exchange with a Pioneer in any chapter. And one point for each different chapter worked.

The same station may be worked on more than one band, but only one mode per band.

Frequencies: Phone—3965, 7275, 14295, 21365, 28675, 50.100 to 50.250, 144.275 to 145.500. C.W.—3565, 7065, 14065, 21065. Also any frequency permitted by FCC regulations for RTTY, SSTV, 160, etc.

Be sure to indicate your chapter name on your log and mail no later than January 15th to Gene Przebieglec, WB2ZMU, Stanley S. Holmes Chapter #55, Telephone Pioneers of America, 100 Central Avenue, Kearney, N.J. 07032

Alexander Volta RTTY Contest

Starts: 1200 GMT Sat. December 2
Ends: 1200 GMT Sun. December 3

This is the 14th annual RTTY Contest organized by the Associazione Radioamatori Italiani of Como. Use all bands 3.5 thru 28 MHz. The same station may be worked on each band for QSO and multiplier credit, however contacts between stations in the same country have no value.

Exchange: QSO no., RST and CQ Zone.

Points: Contacts between stations in the same Zone count 2 points, with stations outside own Zone according to points in the Exchange Point Table. If made on 7 MHz. double the value, and triple if made on 3.5 or 28 MHz.

Multiplier: Of one for each country worked on each band. (ARRL list and each W/K, VE and VK call area.)

Final Score: Total exchange points × total multiplier × total number of QSOs. You can add 1000 bonus points to the final score for each I/IS/IT station you work on all bands.

Awards: Appropriate awards for the 3 top scorers. Points made in this contest will be included in the "World RTTY Championship" for 1978.

There is also a SWL category with the same rules as above.

Entries must be received before January 20,1979 therefore air mail is recommended. They go to: A.V. RTTY Contest, c/o SSB & RTTY Club, P.O. Box 144, 22100 Como, Italy.

10-X Net QSO Party

1200 to 2400 GMT Sun. December 3

CIRCLE 23 ON READER SERVICE CARD

This is a new one organized by the Flatland Farmer chapter of the 10-X International Net.

Activity will be found between 28700 and 28800 MHz.

Contacts with stations not holding a Flatland Farmer certificate are worth one (1) point, two (2) points if with a certificate holder, and three (3) points if station is a Charter member. (This information will be included in the exchange.)

You can qualify for a certificate by working two Flatland Farmer certificate holders. Write to Lou Reik, WB9YJE, 804 Commercial St., Danville, Ill. 61832 for details.

Party certificates will be awarded to 1st, 2nd and 3rd place winners in each U.S. call area including KH6 and KL7. Also to other outside and overseas areas. There is a special award to the top scoring station world wide.

Mailing deadline for your log is January 15th and they go to; Mike Reik, WB9YJF, 304 McKinley St., Westville, Ill. 61883

Connecticut QSO Party

Starts: 2000 GMT Sat. December 2
Ends: 0200 GMT Mon. December 4
(Rest period 0500 to 1200 Dec. 3)

The Candlewood A.R.A. is the sponsor of this party. Their club station W1QI will operate c.w. on odd hours and s.s.b. on even hours.

The same station may be worked on each band and mode, including Oscar as a separate mode. Mobiles in each county change.

Novices should identify themselves by /N as part of their call. Mobiles should also identify their county of operation.

Exchange: QSO no., RS(T) and QTH. County for Conn., ARRL section for others.

Scoring: One point per QSO, 2 points if it's with a Novice, 3 points for Oscar contacts, and 5 points for club station W1QI contacts.

Multiplier: ARRL sections for Conn. stations. Out of state stations use Conn. counties. (max. of 8) DX stations may be worked for QSO points but used only *once* as a multiplier.

Frequencies: CW-40 kHz. up from bottom of each band. SSB-3927, 7250, 14295, 21370, 28540. Novice-3725, 7125, 21125, 28125.

Awards: Certificates to top scoring single and multi-operator stations in each Conn. county, and each ARRL section. (min. of 5 QSOs) Special certificates for Conn. mobiles operating outside their home county. (min. of 20 out of state QSOs)

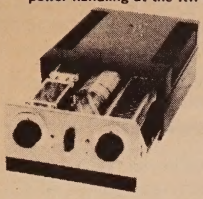

A Worked All Conn. Counties certificate will be awarded for working all 8 counties.

Include a large s.a.s.e. for a copy of the results and mail your log by January 3rd to: CARA att: Fred Porter, W1VH, 169

Apollo Products-Little Giant Trans Systems Tuner Kit — $122.50

ALSO AVAILABLE FACTORY WIRED AND TESTED AT $144.50

Designed and engineered after "Apollo" — "Little Giant" 2500X-2, for an "engineered performance" Trans Systems Tuner and Adaptations of the Lew McCoy Transmatch, with power handling at the KW plus level!

Kit includes:

1 200 pfd wide-spaced variable with isolantite insulation rated 3,000 volts
1 200 pfd dual section parallel condenser isolantited
2 finger-grip pointer knobs 2" diam. white indented
1 pvc insulated shaft couplings ¼ to ¼
3 SO-239 coax chassis connectors. Tunes 52 ohm or 52-300-600* or random wires
1 heavy inductance for 10-15-20-40-80 meters
6 pvc stand-offs, 4 for condensers and 2 for inductance
1 HD switch for band catching 10 thru 80 meter coverage
1 pkg 12-gauge tinned round wire
Cabinet included — Apollo "Shadow Boxes" M Kit includes schematic. Recommend parts layout. INFO NOTE *377 OHM and **600 OHM "Open wire spaced ladder line" air dialectric.
*53 x wire diam. **84 x wire diam. info only — not supplied.

TIMETRAC the microcomputer controlled appointment clock

By Comus

THE ONLY CLOCK OF IT'S KIND NONE CAN COMPARE

NOT A KIT **Reg. Price 79.95**

NEW FIRST TIME OFFER

INTRODUCTORY OFFER
By HAL-TRONIX
ONLY $69.95

TIME-TRAC SOLD AND DISTRIBUTED BY HAL-TRONIX. DEALERS WELCOME.

RELAX AND LET TIMETRAC DO YOUR REMEMBERING.
TIMETRAC helps manage your busy schedule, increases your efficiency. Every home and office needs TIMETRAC.

TIMETRAC—THE CLOCK THAT REMEMBERS.
This is the exciting, all new time-minder that combines space-age technology with every-day practicality. It remembers and reminds you of everything that you might forget. TimeTrac combines smart, modern design with precision and performance. Its vacuum fluorescent display provides readability from a distance (the largest display on the market today). You control the display brightness with a dimmer switch.

FOR THE BUSY EXECUTIVE
Controls length of business meetings. Reminds you 10 minutes ahead of time to prepare for meeting and gives you time to clear your desk. Reminder of wife's birthday. Reminder to catch plane for important business trip.

FOR THE SENIOR CITIZEN
Medication reminder. Reminder of grandchildren's birthdays, doctor appointments. Easy-to-read large display. A wonderful gift for Mom and Dad.

FOR THE STUDENT
Timer for chemistry lab, bio lab. Timer for solving problems or preparation for exams.

FOR THE PHOTOGRAPHER
Timer for photographic development chain. Can insert red digital display filter to avoid damaging film.

FOR THE ATTORNEY
Records client's time charges, meetings, phone calls, research. Timer with built-in pause capability provides accurate way of timing speech presentations.

TIMETRAC FEATURES

- *Sleek modern styling to compliment any home or office decor.*
- *Tells the time.*
- *Tells the date and year.*
- *Up-timer to 60 minutes, 59 seconds with pause.*
- *Alarm to ring at the same time, everyday.*
- *Daily appointment sets appointments for the next 23 hours, 59 minutes.*
- *Future appointments up to one year.*
- *Dimmer switch for display.*
- *Memory will hold up to 30 appointments.*
- *Lithium power cell to retain memory during power outage.*
- *Appointments entered out of chronological order will be stored in chronological order.*
- *Colon flashes once each second.*
- *A.M./P.M. indicator.*
- *Plugs into any wall outlet.*
- *Easy to read vacuum fluorescent display.*
- *Extremely accurate quartz crystal clock.*

ARRL 10 Meter Contest

Starts: 0000 GMT Sat., December 9
Ends: 2359 GMT Sun., December 10

This is the 6th annual 10 meter contest organized by the ARRL, and even in this period of low sunspots it has gained wide popularity.

It's a worldwide activity in which DX stations are permitted to work other DX. You are not limited to working W/K's and VE's only. The same station may be worked once on phone and once on c.w. No cross mode however. A maximum of 36 hours of operating time is permitted out of the 48 hour contest period

Exchange: Stations in the 50 U.S. states and Canada send RS(T) and a consecutive contact number starting with 001. (KP4, KV4, KZ5, KG6 and etc. use a contact number) Stations not land-based give their ITU region.

Scoring: Each completed, QSO is worth 2 points, 4 points if it's with a Novice or Technician. The multiplier is determined by the U.S. states, VE call areas, DXCC countries and ITU regions worked. (non-landbased stations.) (U.S. and Canada not counted as a country.)

Frequencies: C.W.—28000-28050 Novice—28100-28150. S.S.B.—28500-28600. A.M.—28800-28900. Oscar contacts also permitted.

Awards: Certificates to the highest scoring single operator entry in each ARRL section, VE call area and DX country. Multi-operator and Novice awards will be given if three or more entries in a section are received.

As with all ARRL activities it is recommended that you send a large s.a.s.e. for appropriate log forms and instruction sheets.

Mailing deadline for entries is January 5th . ARRL Communications Dept., 10 Meter Contest, 225 Main Street, Newington, Conn. 06111

Hungarian C.W. Contest

Starts: 1600 GMT Sat., December 10
Ends: 1600 GMT Sun., December 11

It's the world looking for HA's on all bands, 3.5 thru 28 MHz. on c.w. in this one.

Operation will be in three classes: Single operator, single band and all band, and multi-operator all band. (Club stations are considered as multi-operator.)

Exchange: RST plus a contact number starting with 001. In addition the HA's will send two letters to identify their county.

HA counties: BA, BP, BE, BN, BO, CS, FE, GY, HA, HE, KO, NO, PE, SA, SO, SZ, TO, VA, VE, ZA, (Total 20 on each band)

Scoring: One point for each HA contact. And a multiplier of one for each different HA county worked on each band. (Same station may be worked once on each band.)

Final Score: Total QSO points from all bands times the sum of the county multiplier from each band.

Awards: Certificates to the first place winners in each country and in each class.

Include a summary sheet with your log and the usual signed declaration. Send within six weeks after the contest (approx. Jan. 21st) to: Radio Amateur League of Budapest, P.O. Box 2, H-1553 Budapest, Hungary.

Tops 80 Meter C.W. Contest

Starts: 1800 GMT Sat., December 2
Ends: 1800 GMT Sun., December 3

This is the TOPS C.W. Club's annual contest, and as the title indicates the activity will be on 80 meters. For the contest it will be between 3.5 and 3.6 MHz, with DX on the low end.

Entries may be single or multi-operator.

Exchange: RST plus a contact number starting with 001.

Scoring: Contacts within own country, 1 point. With stations on the same continent but a different country, 2 points. With stations on other continents, 5 points. Contacts with HQ stations, GW8WJ or GW6AQ, are worth 25 points. (Each call area in W/K, VE/VO, UA and VK count as separate countries.)

Final Score: Total QSO points multiplied by number of different prefixes worked. (Same as WPX.)

Enclose a s.a.e. and IRC for copy of results.

Mailing deadline for your entry is January 31st to: Peter Lumb, G3IRM, 14 Linton Gardens, Bury Saint Edmunds, Suffolk IP33 2DZ, England.

S.O.W.P. C.W. QSO Party

Starts: 0000 GMT Sat., December 16
Ends: 2400 GMT Sun., December 17

The Society of Wireless Pioneers will be holding their annual winter QSO party and this year have gone back to their traditional c.w. mode.

There will be no set exchange or any scoring system. It's just a social "get-together" to exchange Holiday greetings.

Activity will be found in the General portion of each band, about 55 kHz up from the low edge of the band.

Since there is no scoring and no awards are being made no logs are requested.

Listen for the S.O.W.P. Net at 1500 GMT on 14125 MHz. c.w. each Thursday for more details.

Additional information can be obtained from Bill Willmot, K4TF, 1630 Venus Street, Merritt Island, FL 32952

Index to CQ Vol. 34—1978

ANTENNAS, TOWERS, TRANSMISSION LINES

All-Band Antenna Tuner, A Versatile (Schultz, W4FA) . . . . . 24, Aug.
Antennas, 10, 15 And 40 Meter (Antennas) . . . . . 51, Dec.
Antenna at KP4RF, The Block-Buster (Antennas) . . . . . 64, Aug.
Antenna Height VS Performance (QRP) . . . . . 64, May
Base Loading A Simple Antenna For Two Band Use (Price, W6IRA) . . . . . 24, June
CB Mobile Antenna For Two Meter Use, Gimmicking A (Geiser, WA2ANU) . . . . . 71, Aug.
Delta Loops, Multiband Antennas (Antennas) . . . . . 61, May
General Radio 821 R.F. Admittance Bridge, The (Nagle, K4KJ) . . . . . Part I 18, July Part II 54, Sept.
Great Circle Charts, "Gaucho Hat" Antennas and Much More (Antennas) . . . . . 47, Jan.
Ham-M Rotor, How To Update (Klinman, W3RJ) . . . . . 34, May
K3WX Antenna Farm, A Look At The (Antennas) . . . . . 66, Oct.
K5DUT Monster Quad, VK3XU Anti-Noise Bridge, W7TO Multiband Antenna, JG1UEA Mini-Loop Antenna (Antennas) . . . . . 59, June
Log-Periodic Antennas In VHF And UHF Amateur Service (White, ex W2JLP, K3WBH) . . . . . 18, April
Miniature Quad Loop Antenna For 15/20 Meters, A (Bourne, ZL1OI) . . . . . 28, March
Monster Quad, More On The (Antennas) . . . . . 65, March
Reflected Waves And Mismatched Loads (Kramer, K2KGF) . . . . . 55, June
R.F. Faucet, A Simple Two Meter Mobile Antenna, The (Tutwiler, WA4TPE) . . . . . 64, Sept.
Screen Reflector Array For 220 And 432 MHz, The Double-Barreled Whirling Bedspring Antenna, A (White) . . . . . 24, Feb.
Single Wire Antenna For 160, 80, And 40 Meter, A (Steckler, K2OT) . . . . . 30, Jan.
Two In A Hurry: Some Novel Antenna Ideas, Getting On (Thurber, W8FX/4) . . . . . 56, March
Wave Antenna, The (Davis, W8MTI/W8TMI) . . . . . 24, May
Wire All-Band Antennas (Fisher, W3KNG) . . . . . 67, Nov.
W2ONV Delta/Slope Antenna, The (Salerno, W2ONV) . . . . . 52, Aug.

CIRCUITS AND DESIGN

DON'T KEEP A GOOD ANTENNA DOWN

. . .put it up instead. Install the World-Record Breaking antenna that won W6TYP the QRP ARC 1,000,000 miles/watt award.

THE JOYSTICK VFA

(Variable freq. ant) gives low angle, omni-directional, harmonic free radiation on all bands 160 thru 10 (+ MARS and receive on all BC & SW).

1000's of glowing reports in our files of the VFA in use, often in poor QTH and/or under QRP, contests, etc.

SYSTEM 'A' $84.00
250W P.E.P. &/or Receiving only

SYSTEM 'J' $110.00
500W P.E.P. &/or Improved Q Factor Receive

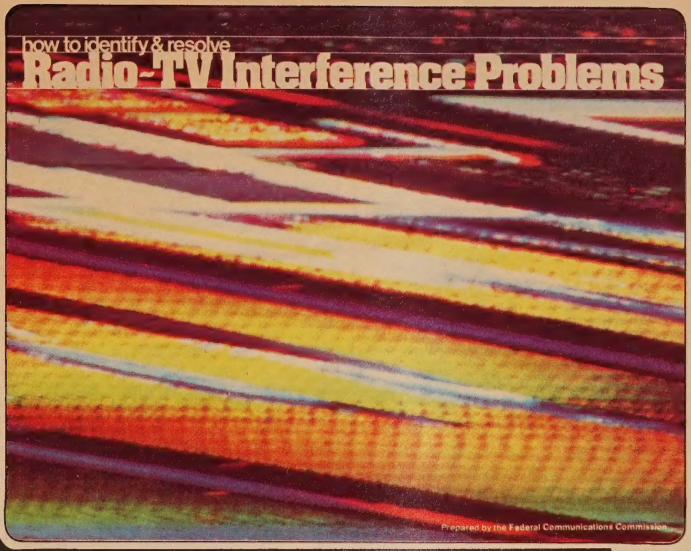

Air mail cost included (Each system 3 sections easily assembled to make unit 7'6" long. Matching ATU). Not only will you save space but you get better value per $ if buying direct UK manuf. Rush your Mastercharge, Visa, Bankamericard, or check, or ask for brochure:-

BUY YOURSELF A GIFT!

A nice way to get yourself, a friend, or a loved one, started in a relaxing hobby. Nothing advanced — the very best beginning for starting a radio building hobby. A nicely gift boxed set of a good quality open type crystal detector, headphones and aerial kit. Not cheap stuff. Includes instructions and copy of rare 1943 edition of Allied's Radio Builder's Handbook — not available anywhere else. Old radio fans and nostalgia buffs will love it! Great for Christmas, birthdays, or just because you like someone. If not satisfied, money refunded if returned within 30 days. $24.95 includes shipping. Ohio residents add sales tax.

R.A. RUSS CO.
"Early Era Originals"™
Box 601 Fairborn, Ohio 45324

Let the FCC's own Radio-TV Interference booklet be your club's first line of defense on the TVI front.

For the first time here's an easy-to-read guide showing all of the classic TVI symptoms and their cures.

Use it as a "handout" by the local TVI committee, defuse tricky "irate neighbor" situations, help the local TV repair shop root out RFI/TVI problems in your area.

This top-quality booklet (40 pages 10¼ x 8") is available in quantities of 12 at $9.00 plus $1.00 shipping. Single copies are available for $1.25, postpaid. Note that the FCC offers the self-same booklet for $1.50 per copy with no quantity discount.

Prepared by the Field Operations Bureau of the Federal Communications Commission and reprinted at low cost by the Publishers of CQ, the booklet offers guidelines for the amateur, non-amateur and CBer alike in dealing with RFI and TVI. A dozen full-color illustrations show most interference patterns with descriptions and solutions for each problem.

The booklet should be on your "must" list for reading and your "do" list to help eliminate the problem. Order a dozen copies today!
